

Airborne Wind Energy Workshop

23 – 24 May 2012

K.U. Leuven, Optimization in Engineering Center, Belgium

The Rough Way of Making Visions Fly

Lessons Involuntarily Learnt From Controlling Aircraft

Florian Holzapfel, Patrick J. Lauffs

Institute of Flight System Dynamics, Technical University of Munich, Garching, Germany

To *invent* an airplane is nothing.
To *build* one is something.
But to *fly* is everything.

Otto Lilienthal

Facts and Figures

- **Institute of Flight System Dynamics**

- Established October 2007
- Former *Institute of Flight Mechanics and Flight Control*

- **Professors**

- Prof. Dr.-Ing. Florian Holzapfel
- Prof. Dr.-Ing. Dr. h.c. Gottfried Sachs
- Prof. Dr.-Ing. habil. Otto Wagner

- **Senior Researchers**

- Dr.-Ing. Matthias Heller – Rudolf Diesel Fellow
- Dr.-Ing. Dipl.-Math. techn. Johann Dambeck

- **Researchers**

- 37 scientific employees / PhD students including five foreign researchers
- Eight external PhD students
- Goal 2012: 45+ employees

Research Flight Simulator

Student Flight Simulator

Certifiable Flight Simulator
FTD Level 5+ / Level 6

Representative Flight Control
Hardware (Iron Bird & Actuators)

Low-Cost Sensors
(GPS, Inertial, Pressure, Loggers, ...)

Three Quadcopters fully equipped,
Sensors, Controllers, Data Links, ...

Three different Fixed Wing UAVs

Fly-By-Wire GA Iron Bird

Motor Glider Grob G-109B

EMA Actuator and Testbed,
AFDX Data Bus, Interface ...

Development / Procurement

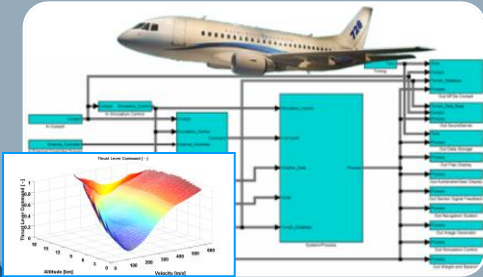

Twin-Engine Flying Testbed DA42MNG

Certifiable Avionics Platform

Additional Sensors:
Laser, Radar, Scanners, Airdata ...

Modeling, Simulation & Parameter Estimation

Main Research Areas

Flight Control & Flight Guidance

Trajectory Optimization

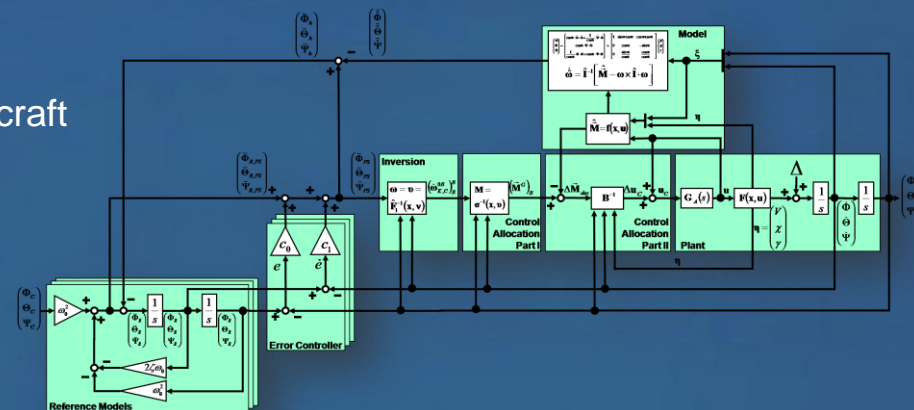

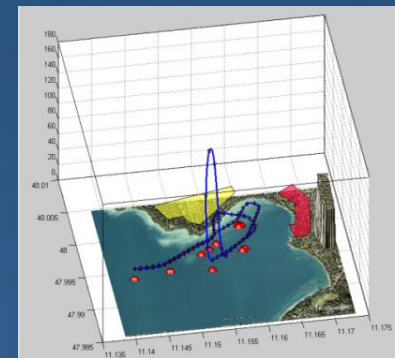

Sensors, Data Fusion & Navigation

Flight Control & Flight Guidance

- High Level Objectives:
 - Development of control algorithms for real flying systems (manned and unmanned)
 - Application of modern control theory to flying systems
 - Fault tolerant flight control systems
 - Certifiable control systems with guaranteed stability, robustness and performance characteristics
 - Excellent handling qualities and intuitive flying of manned aircraft
 - Increased safety for manned and unmanned aircraft

Trajectory Optimization

Mayer Cost Function

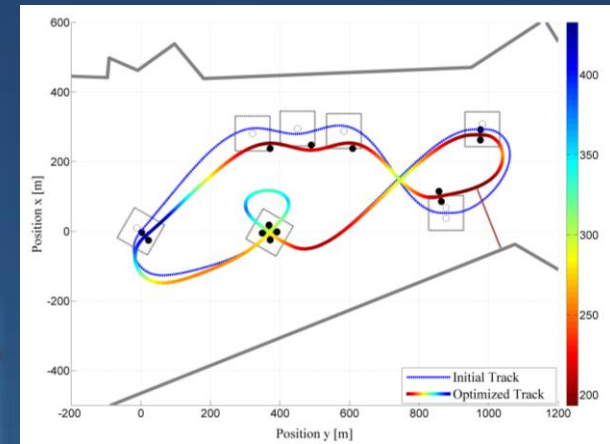

Minimizes/ maximizes properties at the beginning or at the end of the trajectory, includes limits for the whole trajectory:

- Flight time
- Fuel consumption
- Maximum range
- Maximum load factors
- Endurance
- Energy at the end of the trajectory:
 - Kinetic/ potential energy
 - Energy stored in fuel cells/ batteries

Lagrange Cost Function

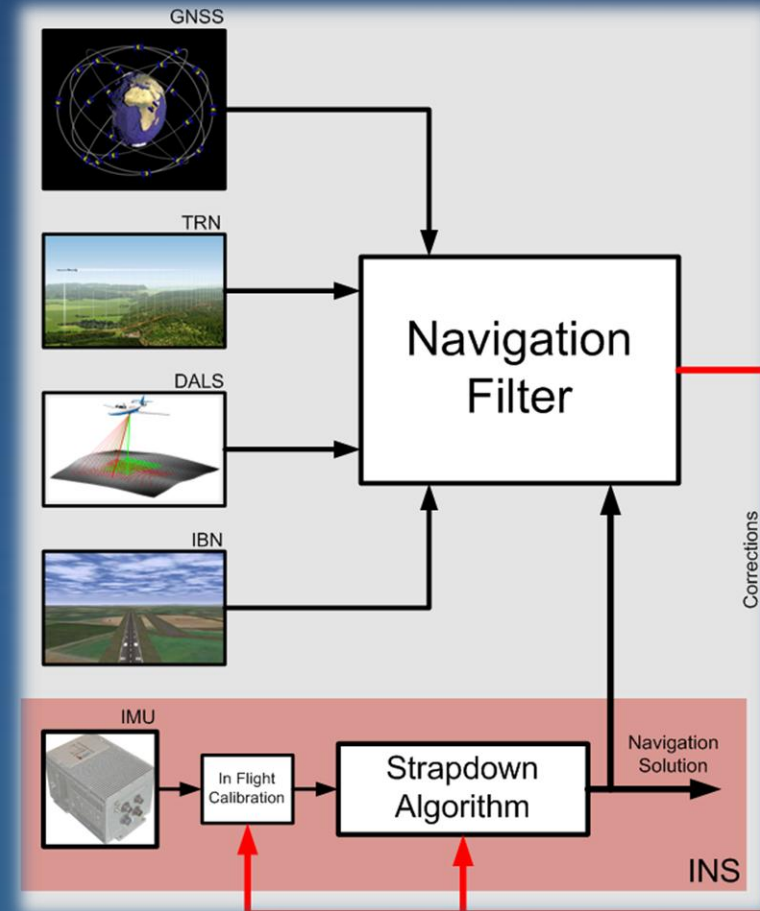

Integral cost function,
accumulation over the trajectory

- Emissions
- Noise
- Threats
- Re-entry heating
- Control rates/ actuation activity
- Structural stress/ fatigue

Navigation & Data Fusion

- High-performance algorithms for (low-cost) navigation sensors
- Research on modern sensor data fusion concepts
- Navigation system performance and integrity monitoring
- Analysis of modern navigation techniques:
 - Imaged-based navigation (IBN) (indoor applications, Vision Enhanced Autoland System)
 - Dual Airborne Laser Scanner (DALs)
 - Terrain Reference Navigation (TRN)
- Application of dynamic models and methods from system identification and integrated navigation
- Simulation-Toolbox for integrated nav. systems (Inertial navigation systems, GNSS simulation, data fusion filters, sensor error propagation analysis, ...)
- Demonstration of navigation algorithms on UAVs

Our Academic Research in Flight Control at FSD

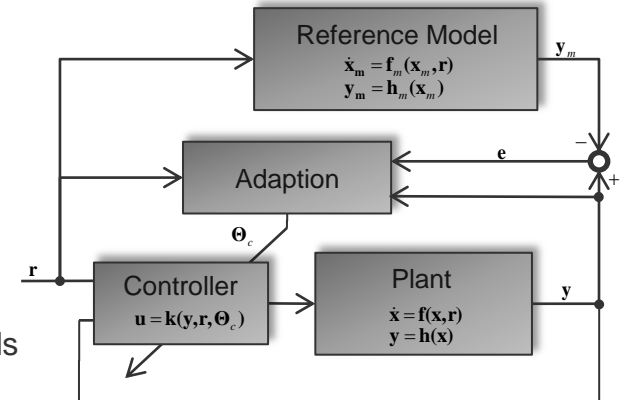

Nonlinear Adaptive control

Aspects dedicated to Adaptive Control

- Controlling deterministic time continuous systems with parametric and dynamic uncertainties
- Online parameter estimation based on measured error signals to maintain consistent performance in the presence of uncertainties and failure
- Adaptive control techniques can be used to augment existing, robust controllers in order to optimize performance
- Adaptive control can maintain performance in adverse conditions
- Has the potential for saving time and money
 - No exact models needed as in classical control approaches
 - Plant dynamic is assumed to be unknown
 - Uniform performance for all possible unknown dynamics
- In the recent years a coherent theory was developed and adaptive control was used in many practical applications

Nonlinear Adaptive Control

- Control Objectives – “Our Objectives”
 - Autonomous following of highly curved trajectories
 - Full utilization of control power and redundancy (all control surfaces, max. amplitude und max. rate)
 - Dynamic adherence to flight envelope limits (without conservative margins)
 - Control objective conflict resolution: conflicting / unachievable commands
 - High robustness – model, parameter and sensor uncertainties
 - Fault Tolerant, Robust Flight Control
 - Adaptive control – failure, configuration change: “Never-Give-Up-Strategy“ (e.g. blocked control surfaces; sensor loss)
 - Fast adaptation to increase survivability and reduce the dependence on model data
 - Certifiable adaptive systems with guaranteed stability, robustness and performance
 - Design of adaptive controllers based on performance and robustness metrics
- Applications in Multiple Projects:
 - NAFC
 - NICE
 - FAT
 - MODUAV
 - ALUSTRA

Nonlinear Adaptive Control

- Nonlinear Dynamic Inversion
- Lyapunov's Direct Method
- Backstepping, Adaptive Backstepping
- Direct MRAC, Indirect MRAC, Composite MRAC
- L1 Control
- Update Laws (Derivative Free, Gradient, Filter, Lyapunov Based)
- Nonlinear Regressors (e.g. Neural Networks)
- Reference Models (linear, nonlinear)
- Robustness Modifications
- Performance and Robustness Metrics

Adaptive Laws:

$$\dot{\Theta}_x = -\Gamma_x \operatorname{sgn}(\Lambda) \mathbf{B}_p^T \mathbf{P} \mathbf{e}_c \cdot \mathbf{x}_p^T - \sigma \|\mathbf{e}\| \Theta_x$$

$$\dot{\Theta}_r = -\Gamma_r \operatorname{sgn}(\Lambda) \mathbf{B}_p^T \mathbf{P} \mathbf{e}_c \cdot \mathbf{r}^T - \sigma \|\mathbf{e}\| \Theta_r$$

$$\dot{\Theta}_\varphi = -\Gamma_\varphi \operatorname{sgn}(\Lambda) \mathbf{B}_p^T \mathbf{P} \mathbf{e}_c \cdot \boldsymbol{\varphi}^T(\mathbf{x}_p) - \sigma \|\mathbf{e}\| \Theta_\varphi$$

$$\dot{\Theta}_d = -\Gamma_d \operatorname{sgn}(\Lambda) \mathbf{B}_p^T \mathbf{P} \mathbf{e}_c - \sigma \|\mathbf{e}\| \Theta_d$$

Our Academic Research in Flight Control at FSD

Nonlinear Adaptive control

Nonlinear Adaptive Control for Missile Applications

- Different Missile Types: Tail-Controlled Missile, Canard-Controlled Missile (Missile available), Tail-Controlled Missile using Reaction Jets
- Used Adaptation Strategies: L1-Adaptive Control, Model Reference Adaptive Control, Adaptive Backstepping
- Type of Cooperation: Fundamental Research, Research and Development
- Work share of FSD in several projects:
 - Adaptive flight control based on nonlinear dynamic inversion for missiles featuring a high level of uncertainties and nonlinearities
 - Development and assembly of a reusable low cost missile
 - High fidelity missile simulations combined with flight tests
 - Tailoring an Adaptive Backstepping approach to a tail-controlled missile using Reaction Jets

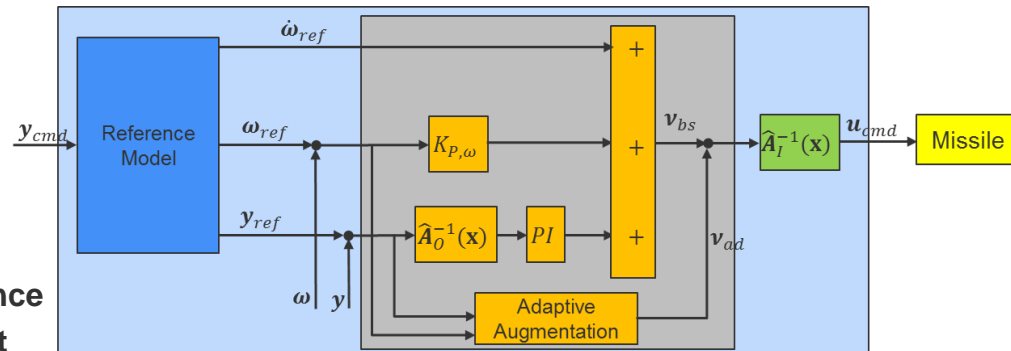

Our Academic Research in Flight Control at FSD

Nonlinear Adaptive control

Nonlinear Innovative Control Designs and Evaluations (NICE) – An EDA (European Defense Agency) project

- Derivation and assessment of different baseline inversion strategies with respect to nonlinearities addressed, relative degree, model assumed for inversion (not necessarily the nominal model), model parameterization
- Applications:
 - Generic surface-to-air missile model
 - Combat aircraft model
- Development of a new, physically motivated Reference Model
 - Highly nonlinear
 - One Reference Model outputting all the necessary signals
 - Uses the full physical capabilities of the plant
- Redesign of the Baseline Controller according to the change in the Reference Model
 - ⇒ Leads to an almost linear error dynamics, which is perfectly suitable for MRAC
- Adaptive Augmentation of the Baseline Controller
 - Direct MRAC
 - L1/PWC
 - ⇒ Physically motivated choice of the learning rates
- ⇒ **New developments lead to an increase in performance and utilizes the full physical capabilities of the plant**

Nonlinear Adaptive Control for Aircraft Applications

- Type of Cooperation: Fundamental Research, Research and Development
- Basic research on Model Reference Adaptive Control (MRAC)
 - Structure (Direct, Indirect, Combined, \mathcal{L}_1 , ...)
 - Regressor (Linear, Nonlinear, Neural Networks)
 - Update laws and modifications (Lyapunov, Gradient, Filter)
 - Robustness modifications for parameter boundedness
 - Design of reference models (linear, nonlinear, constraints, ...)
 - Heging of reference model
- Application to Use-Cases
 - 1) Pitch-up nonlinearity:
 - 2) Nonlinear model of large transport aircraft: Elimination of gain scheduling parameters

Adaptive Laws:

$$\dot{\Theta}_x = -\Gamma_x \text{sgn}(\Lambda) \cdot \mathbf{x} \cdot \mathbf{e}_c \mathbf{P} \mathbf{B}_p - \sigma \|\mathbf{e}\| \Theta_x$$

$$\dot{\Theta}_r = -\Gamma_r \text{sgn}(\Lambda) \cdot \mathbf{r} \cdot \mathbf{e}_c \mathbf{P} \mathbf{B}_p - \sigma \|\mathbf{e}\| \Theta_x$$

$$\dot{\Theta}_\varphi = -\Gamma_\varphi \text{sgn}(\Lambda) \cdot \boldsymbol{\varphi}(\mathbf{x}_p) \cdot \mathbf{e}_c \mathbf{P} \mathbf{B}_p - \sigma \|\mathbf{e}\| \Theta_x$$

Our Academic Research in Flight Control at FSD

Nonlinear Adaptive control

Nonlinear Adaptive Control for Aircraft Applications

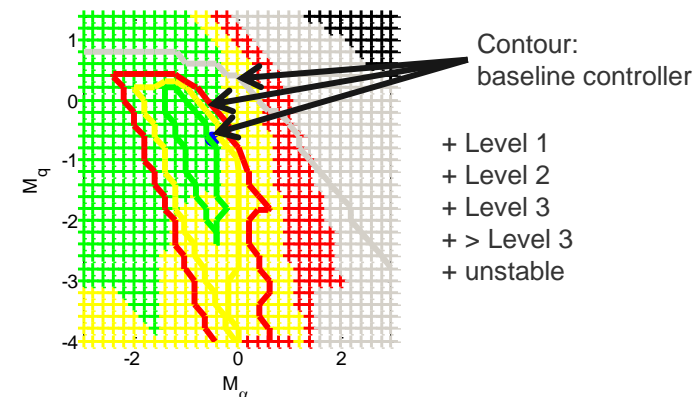

1) Pitch-up nonlinearity:

- Short period model
 - With nonlinear pitch-up
 - Including sensor and actuator model
- To compensate for the nonlinearity different adaptive methods are applied and compared
 - ⇒ Performance Metrics
 - ⇒ Robustness Metrics (Time delay margin)

2) Nonlinear model of large transport aircraft:

- Airbus Simulation Model
 - ⇒ 6DoF model
 - ⇒ Including sensor and actuator model
- Problem: Loss of scheduling parameters (V_{CAS})
- Definition of Requirements
 - ⇒ Handling requirements
 - ⇒ Performance Metrics
 - ⇒ Robustness Metrics (Time delay margin)
- Augmentation of the baseline controller with an adaptive controller
 - ⇒ MRAC
 - ⇒ \mathcal{L}_1 piecewise constant
- Application of Kalman Filter to estimate the scheduling parameters
- Investigation of performance and robustness
- in the presence of uncertainties

Our Academic Research in Flight Control at FSD

Nonlinear Adaptive control

Nonlinear Adaptive Control for Helicopter Applications

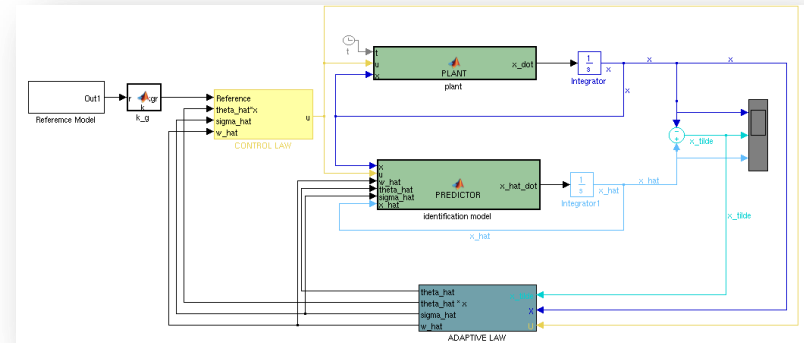

- Project Description:
 - Closed loop real-time simulation with the nonlinear, adaptive L1 control structure
 - Development of a certification strategy for the L1 controller
 - Evaluation in regard to existing baseline controller

Structure:

- For the helicopter a linear baseline controller exists
- In nominal condition, the baseline controller remains the active controller
- In adverse conditions, the adaptive L1 controller augments the linear one

Tasks:

- Implementation of an optional L1 controller by incorporating but not touching the existing baseline controller
- Development of a valid certification strategy
- Comparison of the augmented system with the controller designed for nominal conditions

Our Academic Research in Flight Control at FSD

Nonlinear Control for Quadcopters

- Design Objectives: high bandwidth, robustness and accuracy
 - Able to utilize the accelerometer measurements in the control feedback
 - accelerometer xy axis: external disturbance and aerodynamic forces
- New Mathematical model for control design
 - Novel control variables: to decouple translational dynamics and simplify computations

$$\vec{g}_B = \mathbf{M}_{BW} \cdot \vec{g}_W = g \cdot \begin{bmatrix} 2(q_1 q_3 - q_0 q_2) \\ 2(q_2 q_3 + q_0 q_1) \\ q_0^2 - q_1^2 - q_2^2 + q_3^2 \end{bmatrix} = g \cdot \begin{bmatrix} \sin\theta \cos\phi \\ -\sin\phi \\ \cos\theta \cos\phi \end{bmatrix} = \begin{bmatrix} g_x \\ g_y \\ g_z \end{bmatrix}_B$$

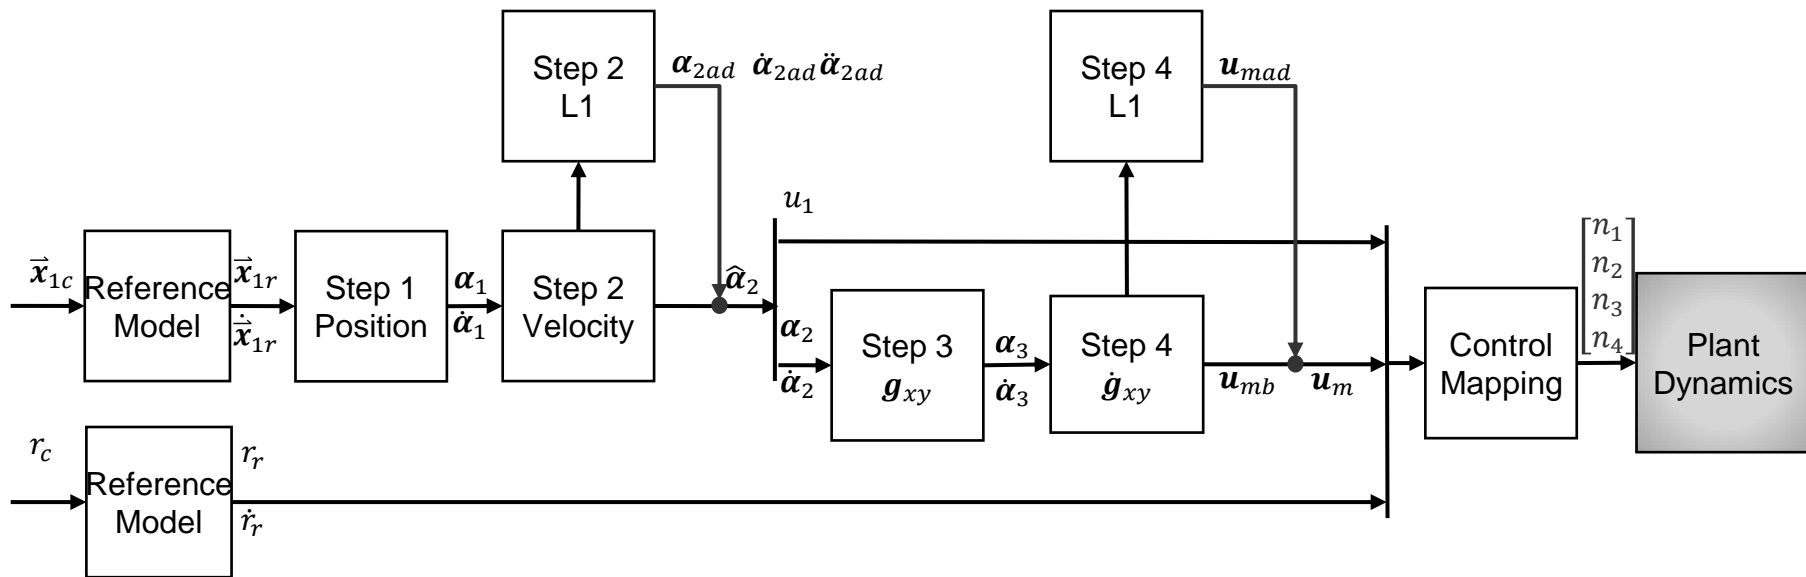

- Translational dynamic equation (W: world frame)

$$\left(\dot{\vec{v}}_k^G \right)_W^{WW} = \mathbf{M}_{WB} \left(\begin{bmatrix} f_x \\ f_y \\ \underbrace{f_z + T/m}_{\approx 0} - T/m \end{bmatrix}_B + \begin{bmatrix} g_x \\ g_y \\ g_z \end{bmatrix}_B \right) = \mathbf{M}_{WB} \left(\underbrace{\begin{bmatrix} f_x \\ f_y \\ g_z \end{bmatrix}_B}_{Meas} + \underbrace{\begin{bmatrix} g_x \\ g_y \\ -T/m \end{bmatrix}_B}_{decoupled\ controls} \right)$$

Our Academic Research in Flight Control at FSD

Nonlinear Control for Quadcopters

- Novel baseline position control structure designs using D.I./backstepping
 - Position loop of Relative Degree (RD) 2 + gxy loop of RD2
 - Position loop of RD3 + Rate loop of RD1 structure
- Augmented L1 adaptive control based on the error model to account for model uncertainties
- Example: L1 Backstepping design structure

Video: Quadrocopter

The Classic View on Flight Control

Specific Challenges of Flying Vehicles

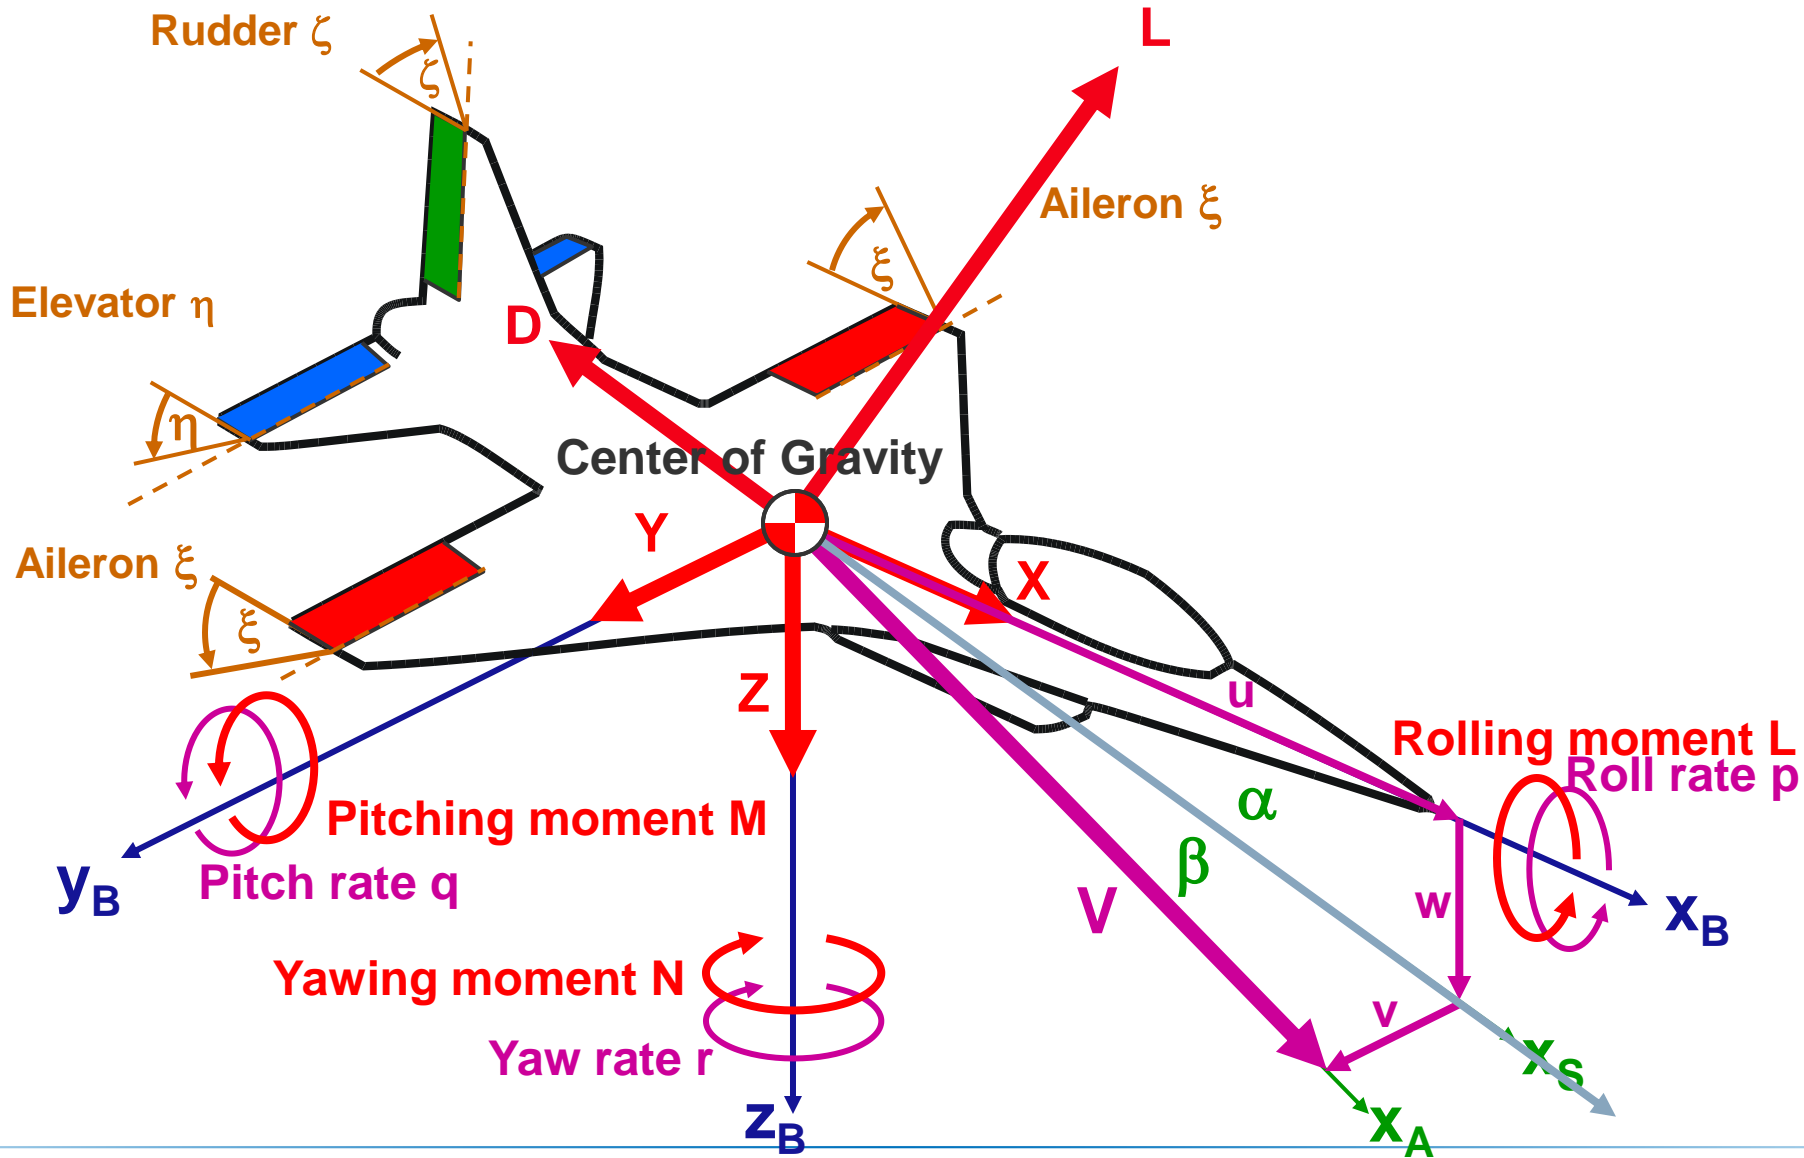

- **Unique Plant to be Controlled: The Aircraft**
 - Profoundly nonlinear plant
 - Large Envelope concerning flight conditions and configurations
 - Strong coupling of variables to be controlled
 - Unavailable or complex measurements
 - Large, manifold & changing model uncertainties
 - Highly dynamic external disturbances
 - Consequences of a Failure
- **Novel Systems (UAV, HAWE, ...)**
 - Unconventional configurations/shapes
 - Novel operational concepts & strategies
 - Increased Need for Automation / Autonomy

⇒ New requirements and challenges

The Classic View on Flight Control

Definition of the most important properties for aircraft dynamics

The Classic View on Flight Control

Definition of the most important properties for aircraft dynamics

Directional Flight

The Classic View on Flight Control

The physics behind steering an airplane

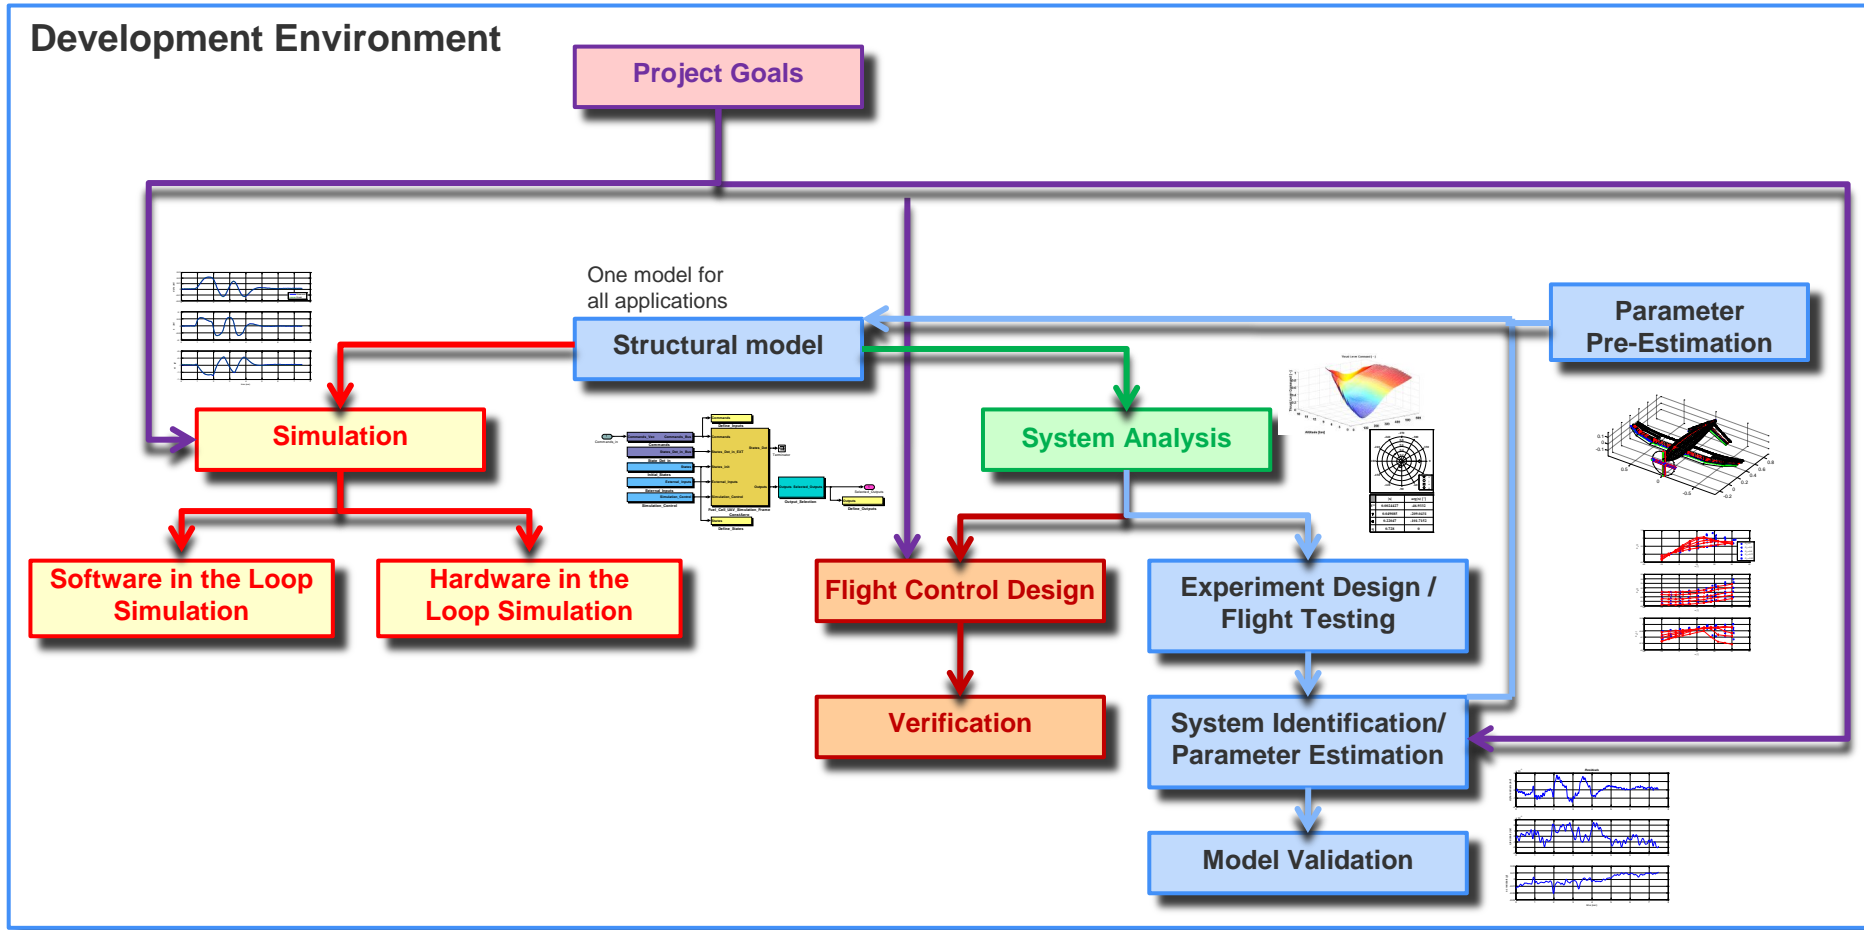

Example: causal chain from elevator deflection η to change in altitude h

$$\Delta \eta \longrightarrow M_\eta \longrightarrow \dot{q} \int \longrightarrow q \longrightarrow \dot{\alpha} \int \longrightarrow \Delta \alpha \longrightarrow \Delta L \longrightarrow \dot{\gamma} \int \longrightarrow \gamma \longrightarrow \dot{h} \int \longrightarrow h$$

The Classic View on Flight Control

Model-based development

The Classic View on Flight Control

The simulation model

Simulation Model:

Mathematical representation of aircraft dynamics based on ordinary differential equations.

State Space Model:

The aircraft motion can be described by the concept of a state space model. It describes the temporal change (first order time derivative) of the state variables as a function of the current state variables and the current inputs (controls and disturbances). The state vector consist of the minimum number of variables (states) required to completely and unambiguously describe the actual situation of the system.

In symbolic expressions:

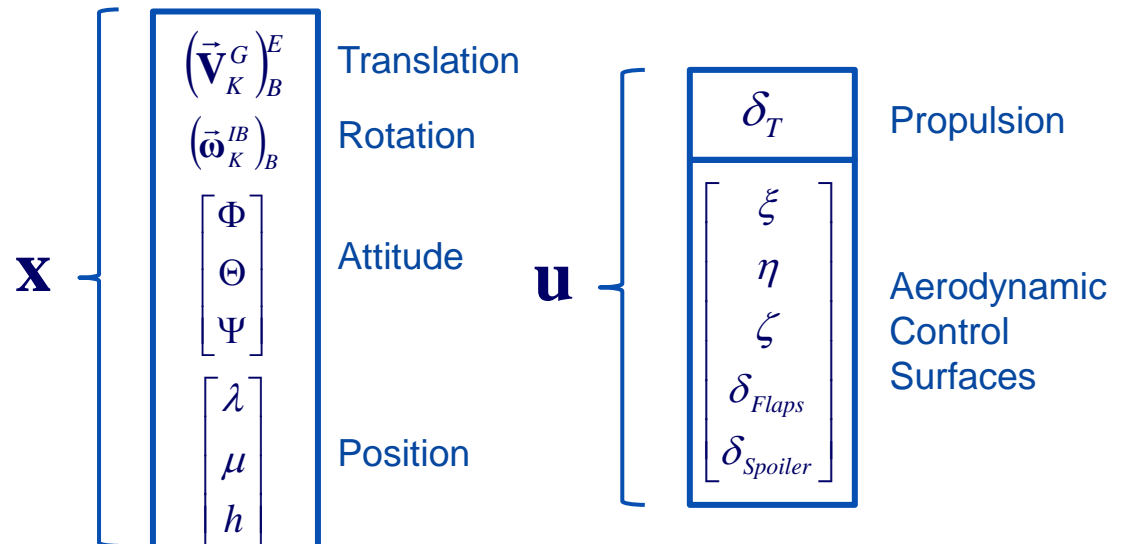

$$\dot{\mathbf{x}} = \mathbf{f}(\mathbf{x}, \mathbf{u})$$

explicit model
(ODE)

$$\mathbf{f}(\mathbf{x}, \dot{\mathbf{x}}, \mathbf{u}) = \mathbf{0}$$

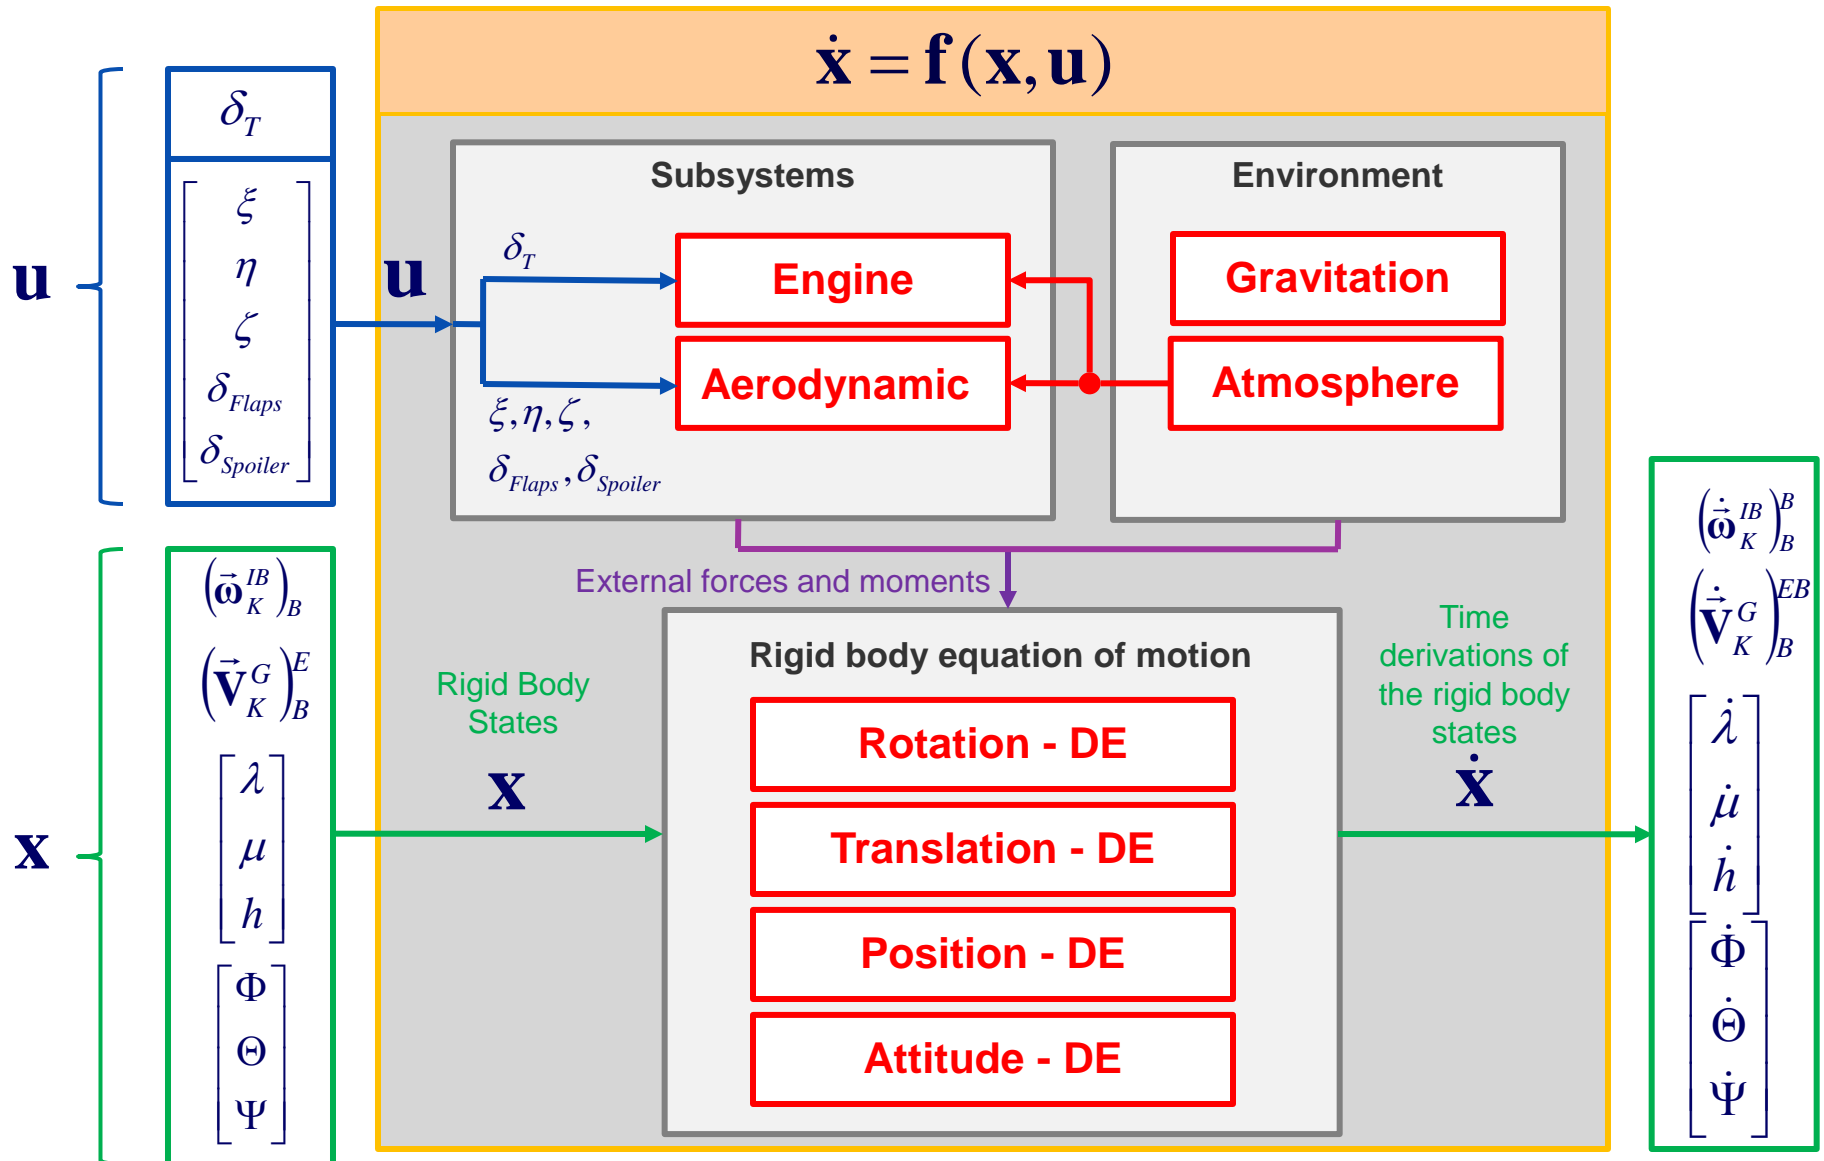

Implicit model
(DAE)

Example: rigid body states and control inputs

The Classic View on Flight Control

The rigid body simulation model

The Classic View on Flight Control

The rigid body simulation model

Force equations, no wind, flat and non-rotating earth

$$\dot{V} = -\frac{D}{m} + \frac{\left[(X_P^G)_B \cos \alpha \cos \beta + (Y_P^G)_B \sin \beta + (Z_P^G)_B \sin \alpha \cos \beta \right]}{m} - g \sin \gamma$$

$$\dot{\alpha} = \frac{-L}{mV \cos \beta} + \frac{-(X_P^G)_B \sin \alpha + (Z_P^G)_B \cos \alpha}{mV \cos \beta} + \frac{g \cdot \cos \mu \cos \gamma}{V \cdot \cos \beta} + [q - \tan \beta (p \cos \alpha + r \sin \alpha)]$$

$$\dot{\beta} = \frac{Q}{mV} + \frac{\left[-(X_P^G)_B \cos \alpha \sin \beta + (Y_P^G)_B \cos \beta - (Z_P^G)_B \sin \alpha \sin \beta \right]}{mV} + \frac{g}{V} \cdot \cos \gamma \sin \mu + (-r \cos \alpha + p \sin \alpha)$$

Moment equations, no wind, flat and non-rotating earth

$$\dot{p} = \frac{1}{\Delta} \cdot [I_{zz} \cdot (L_A^G)_B + I_{xz} \cdot (N_A^G)_B] + \frac{1}{\Delta} \cdot [I_{zz} \cdot (L_P^G)_B + I_{xz} \cdot (N_P^G)_B] + \frac{1}{\Delta} \cdot [I_{xz} \cdot (I_{xx} - I_{yy} + I_{zz}) \cdot p \cdot q - (I_{zz}^2 - I_{zz} \cdot I_{yy} + I_{xz}^2) \cdot q \cdot r] \quad \Delta = (I_{xx} I_{zz} - I_{xz}^2)$$

$$\dot{q} = \frac{1}{I_{yy}} \cdot (M_A^G)_B + \frac{1}{I_{yy}} \cdot (M_P^G)_B + \frac{1}{I_{yy}} \cdot [I_{xz} \cdot (r^2 - p^2) - (I_{xx} - I_{zz}) \cdot p \cdot r]$$

$$\dot{r} = \frac{1}{\Delta} \cdot [I_{xz} \cdot (L_A^G)_B + I_{xx} \cdot (N_A^G)_B] + \frac{1}{\Delta} \cdot [I_{xz} \cdot (L_P^G)_B + I_{xx} \cdot (N_P^G)_B] + \frac{1}{\Delta} \cdot [(I_{xz}^2 - I_{xx} \cdot I_{yy} + I_{xx}^2) \cdot p \cdot q - I_{xz} \cdot (I_{xx} - I_{yy} + I_{zz}) \cdot q \cdot r]$$

Attitude propagation, Euler Angles

$$\begin{pmatrix} \dot{\Phi} \\ \dot{\Theta} \\ \dot{\Psi} \end{pmatrix} = \begin{pmatrix} 1 & \sin \Phi \tan \Theta & \cos \Phi \tan \Theta \\ 0 & \cos \Phi & -\sin \Phi \\ 0 & \frac{\sin \Phi}{\cos \Theta} & \frac{\cos \Phi}{\cos \Theta} \end{pmatrix}_B \cdot \begin{pmatrix} p \\ q \\ r \end{pmatrix}$$

Position propagation WGS-84

$$\begin{pmatrix} \dot{\lambda} \\ \dot{\mu} \\ \dot{h} \end{pmatrix}_0^E = \begin{pmatrix} \frac{v_K^G}{(N_\mu + h) \cos \mu} \\ \frac{u_K^G}{M_\mu + h} \\ -\frac{w_K^G}{-w_K^G} \end{pmatrix} \quad M_\mu = a \frac{1 - e^2}{(1 - e^2 \sin^2 \mu)^{3/2}} = N_\mu \cdot \frac{1 - e^2}{1 - e^2 \sin^2 \mu}$$

$$N_\mu = \frac{a}{\sqrt{1 - e^2 \sin^2 \mu}}$$

Modeling accuracy:

Depending on the purpose of the model, suitable assumptions must be made concerning:

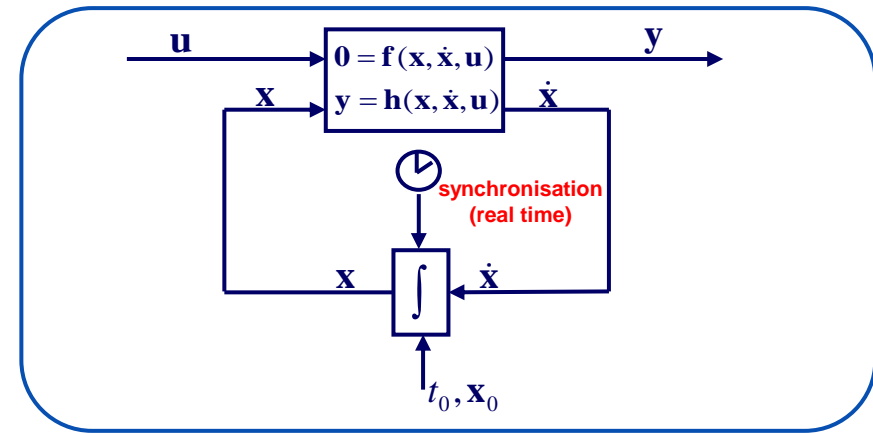

- Scope (rigid body only, dynamic subsystems, ...)
- Fidelity (Earth / gravity / atmosphere model, ...)
- Data fidelity (aerodynamics, propulsion, ...)

The Classic View on Flight Control

Utilization of simulation models in a classical sense

Nonlinear simulation models:

- *Time domain simulation*
- *Single point execution (trim, optimization, ...)*
- *Basis for numerical linearization*
- *Real-time or batch*
- *Piloted, MIL, SIL, HIL, PIL*
- *Final clearing stage before real flight closest to reality*

Linear state space models:

- *Stability and control analysis*
- *Eigenvalues and eigenvectors*
- *Transfer functions*
- *Classic controller gain design*
- *Classic stability margins*

$$\begin{bmatrix} \dot{r} \\ \dot{\beta} \\ \dot{p} \\ \dot{\Phi} \end{bmatrix} = \begin{bmatrix} -0.71 & 6.3 & -0.2 & 0 \\ -1 & -0.23 & 0 & 0.15 \\ 1.57 & -14.6 & -4.3 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} r \\ \beta \\ p \\ \Phi \end{bmatrix} + \begin{bmatrix} 0.04 & -2.6 \\ 0 & 0.04 \\ -12.4 & 1.8 \\ 0 & 0 \end{bmatrix} \begin{bmatrix} \xi \\ \zeta \end{bmatrix}$$

The Classic View on Flight Control

Simulink implementation of the process dynamics (“physical part”)

Atmosphere

- Static atmosphere
- Dynamic atmosphere

Earth model

- WGS 84 ellipsoid
- Round earth
- Rotating / Nonrotating

Magnetic field

- World Magnetic Model

Gravity

- Somigliana

Transformations

- Kinematic relations
- Avoid redundand computation

External Forces

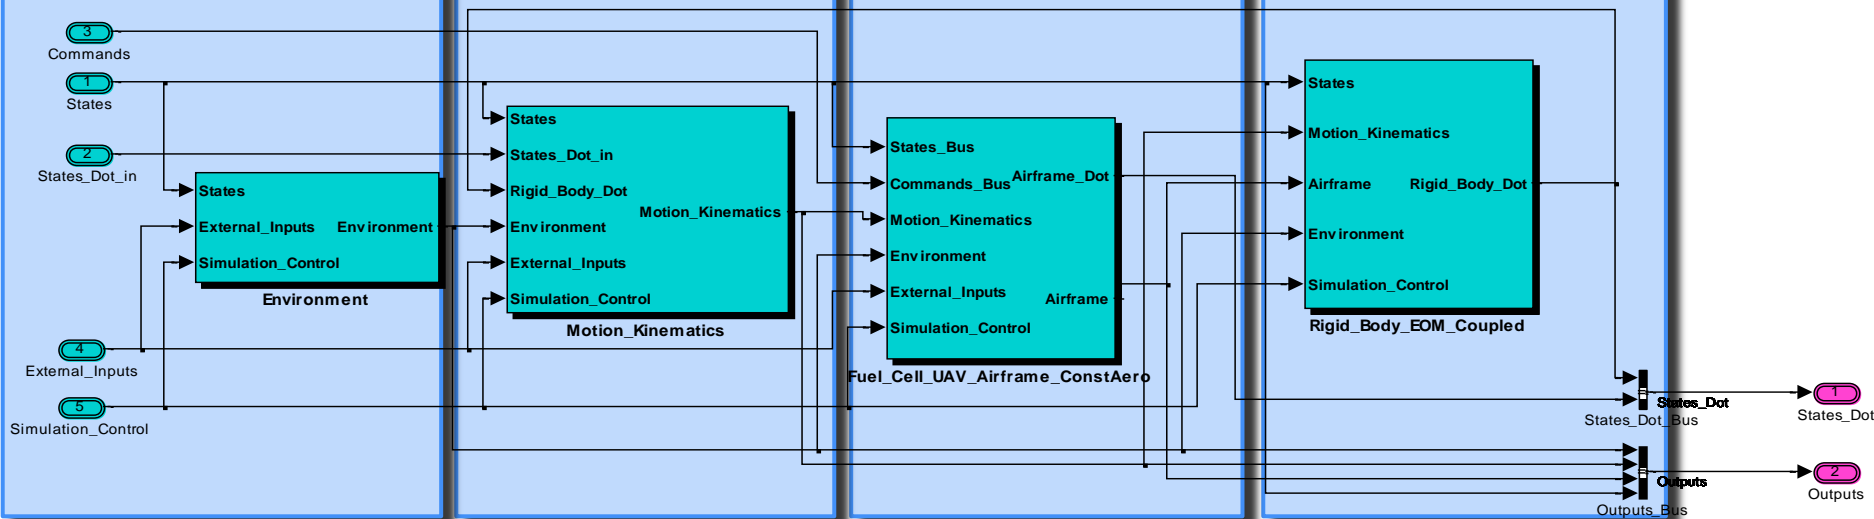

- Aerodynamic f&m
- Propulsion f&m

Subsystems

- Actuation
- Propulsion system
- Landing Gear
- Sensors
- Avionics
- Electrical system
- Hydraulics, fuel, ...

Equations of Motion

- Translation
- Rotation
- Attitude
- Position

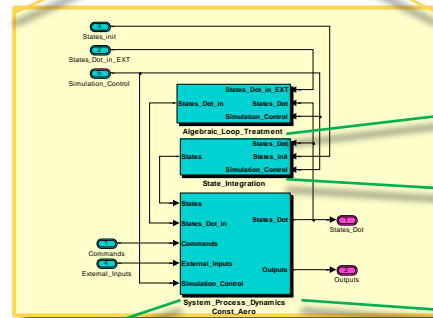

The Classic View on Flight Control

Useful considerations during modeling

- Top Level with interfaces to design, analysis and optimization tools (one model fits all purposes)

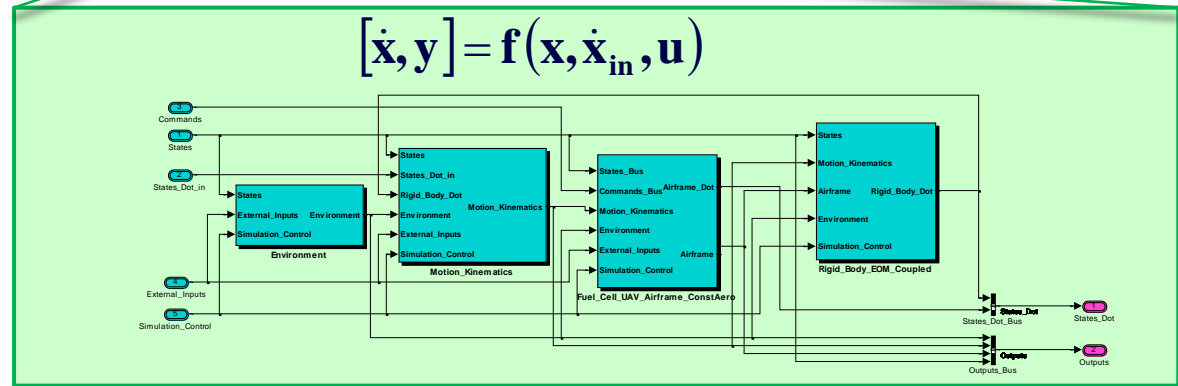

- Separation of system process dynamics and time integration (don't forget single point execution)

$$\mathbf{x} = \mathbf{x}_0 + \int \dot{\mathbf{x}} dt$$

- Modular process dynamics model \Rightarrow fast adaption to new projects/applications (independence from specific configuration)

The Classic View on Flight Control

Parameter Pre-Estimation – Model structure is easy, parameters are hard

- Aerodynamics
- Propulsion
- Control Surface Actuators
- Power Supply
- Weight and Balance
- Landing Gear
- High Lift Devices
- ...

The Classic View on Flight Control

Parameter Pre-Estimation – The usual problem: forces and moments (aero&prop)

- Contribution to the dynamic system

$$\left(\dot{\vec{\mathbf{v}}}_K^G\right)_B^{EB} = \frac{\sum \left(\vec{\mathbf{F}}^G\right)_B}{m} - \left\{ \left(\vec{\omega}_K^{EB}\right)_B \times \left(\vec{\mathbf{v}}_K^G\right)_B^E + 2 \cdot \left(\vec{\omega}_K^{IE}\right)_B \times \left(\vec{\mathbf{v}}_K^G\right)_B^E + \left(\vec{\omega}_K^{IE}\right)_B \times \left[\left(\vec{\omega}_K^{IE}\right)_B \times \left(\vec{\mathbf{r}}^G\right)_B\right] \right\}$$

$$\left(\dot{\vec{\omega}}_K^{IB}\right)_B^B = \left(\mathbf{I}^G\right)_{BB}^{-1} \cdot \left[\sum \left(\vec{\mathbf{M}}^G\right)_B - \left(\vec{\omega}_K^{IB}\right)_B \times \left(\mathbf{I}^G\right)_{BB} \cdot \left(\vec{\omega}_K^{IB}\right)_B \right]$$

- Modelling with the help of nondimensional coefficients

$$\left(\vec{\mathbf{F}}_A^A\right)_A = \begin{bmatrix} X_A^A \\ Y_A^A \\ Z_A^A \end{bmatrix} = \begin{bmatrix} -D \\ Q \\ -L \end{bmatrix} = \bar{q} \cdot S \cdot \begin{bmatrix} -C_D \\ C_Q \\ -C_L \end{bmatrix} \quad \left(\vec{\mathbf{M}}_A^A\right)_B = \begin{bmatrix} L_A^A \\ M_A^A \\ N_A^A \end{bmatrix} = \bar{q} \cdot S \cdot \begin{bmatrix} s \cdot C_l \\ \bar{c} \cdot C_m \\ s \cdot C_n \end{bmatrix}$$

- Consideration of a reduced set of dependencies

$$C_L = C_L(\alpha_A, \beta_A, p^*, q^*, r^*, \dot{\alpha}_A, \dot{\beta}_A, \xi, \eta, \zeta, \delta_{Spoiler}, \delta_{Flaps}, M, R)$$

 $C_L = C_{L0} + C_{L\alpha} \cdot (\alpha - \alpha_0) + C_{Lq} \cdot (q^* - q_0^*) + C_{L\eta} \cdot (\eta - \eta_0) + \dots$

The Classic View on Flight Control

Parameter Pre-Estimation – Initial Aerodynamic Parameters

- Don't overpower (Navier-Stokes, ...)
- Understand the rationale, the math and the physics behind the method
- Know the weaknesses and shortcomings of the method
- Check underlying assumptions and prerequisites (aspect ratio, speed, ...) – scope of validity
- Don't trust tools
- Critically assess and question the results
- Use analytic approximations and scaled data for checking plausibility
- Use more than one method and analyze scatter
- Always be conservative and use worst-case
- Typical methods:
 - Lifting line, lifting line with nonlinear profile aero, panel, empirical (DATCOM, AAA, Roskam), low-fidelity CFD

The results are always colorful – but are they correct and representative?

The Classic View on Flight Control

Parameter Pre-Estimation – Initial Aerodynamic Data

Example – linear lifting line with nonlinear 2D profile polars
consideration of rotating parts

Modeling as second order transfer function

$$\ddot{\Phi} + 2\zeta\omega_0\dot{\Phi} + \omega_0^2\Phi = \omega_0^2u$$

Identification of actuator parameters

- Damping
- Natural Frequency

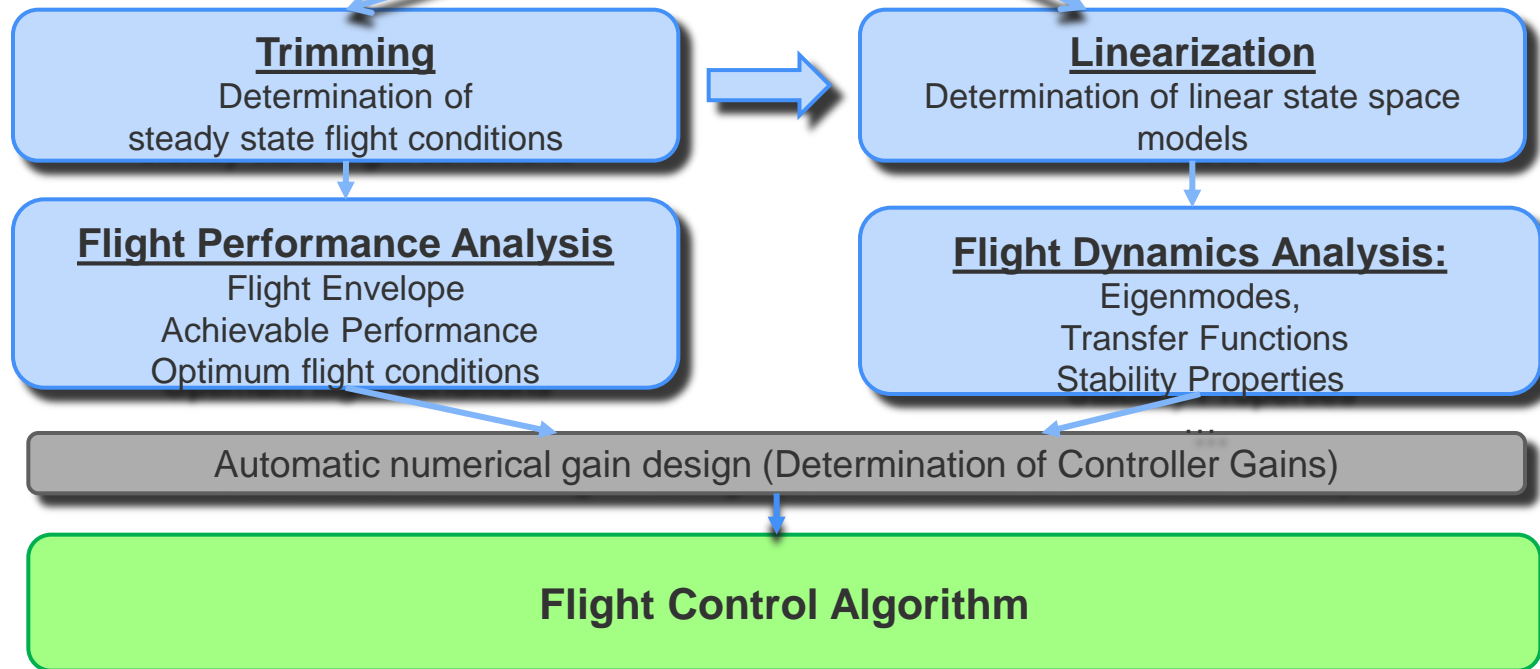

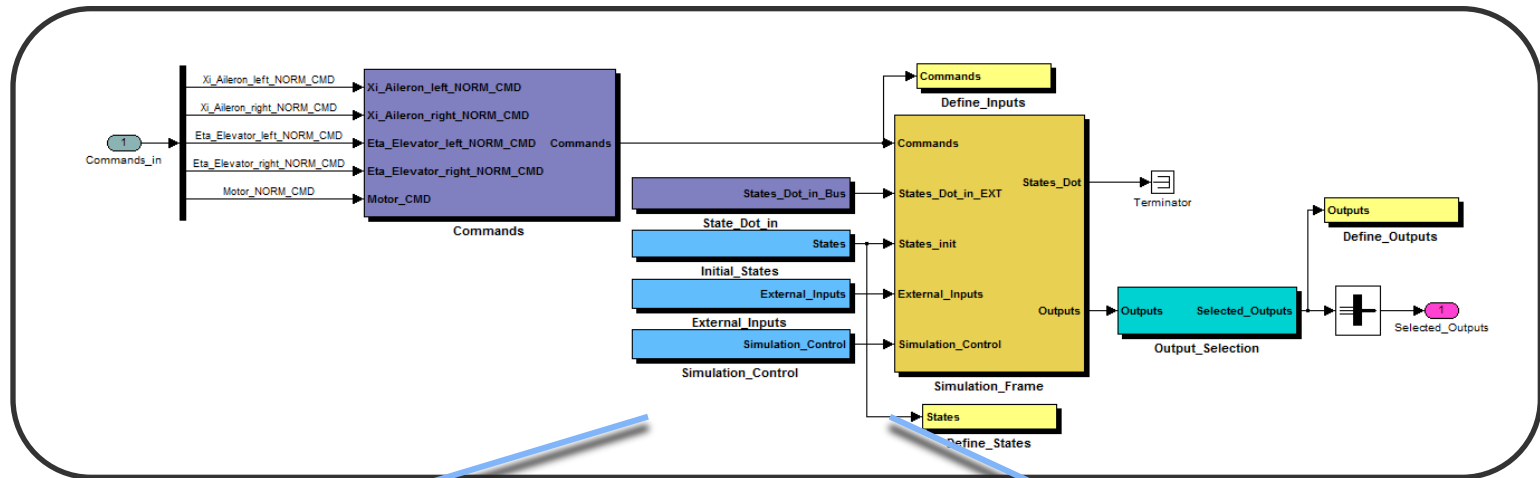

Introduction of typical nonlinearities

- angular acceleration saturation
- rate saturation
- position saturation
- gear backlash
- time delay

The Classic View on Flight Control

Work Flow: Trim–Linearize–Analyze–Design–Compute–Assess – Implement

The Classic View on Flight Control

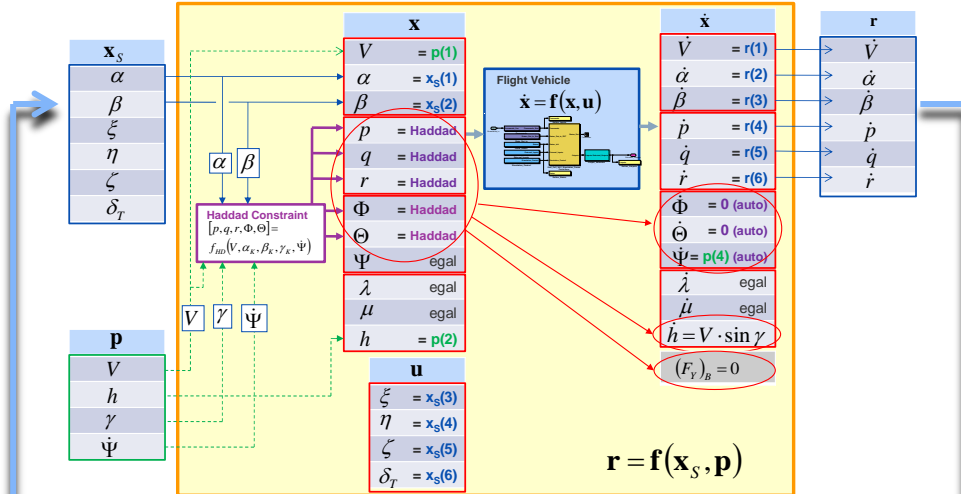

Automated trim and performance assessment

- Trim and flight mechanics tool
 - Efficient and robust algorithms for **steady state trim condition** determination
 - Multi point (grid) trimming with enhanced **trim strategies**
 - Determination of **flight envelope**
 - Automated generation of **flight performance charts**

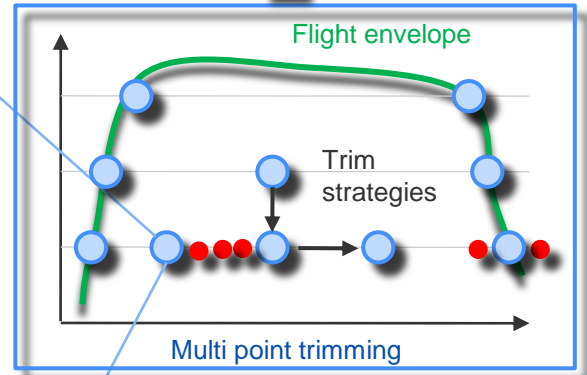

Trim template object

- horizontal flight
- coordinated turning and climbing
- pull up / push over
- engine failure,...

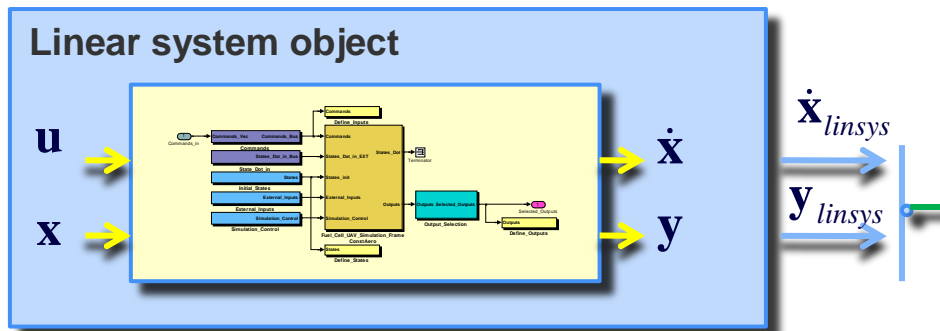

Nonlinear equation solver
 $r = f(x_s, p) = 0$

The Classic View on Flight Control

Automated linearization and stability & control assessment

- Efficient and robust algorithms for the extraction of linear state space model in trim conditions
- Numerical differentiation
- Linear system analysis
- Automated assessment of flying qualities

Numerical linearization

$$\dot{\mathbf{x}}_{linsys} = \mathbf{A}\mathbf{x}_{linsys} + \mathbf{B}\mathbf{u}_{linsys}$$

$$\mathbf{y}_{linsys} = \mathbf{C}\mathbf{x}_{linsys} + \mathbf{D}\mathbf{u}_{linsys}$$

$$\mathbf{A} = \begin{bmatrix} \frac{\partial f_{linsys,1}}{\partial x_{linsys,1}} & \dots & \frac{\partial f_{linsys,1}}{\partial x_{linsys,n}} \\ \frac{\partial f_{linsys,2}}{\partial x_{linsys,1}} & \dots & \frac{\partial f_{linsys,2}}{\partial x_{linsys,n}} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_{linsys,n}}{\partial x_{linsys,1}} & \dots & \frac{\partial f_{linsys,n}}{\partial x_{linsys,n}} \end{bmatrix}$$

The Classic View on Flight Control

Linear state-space models: Aircraft pitch dynamics

$$\underbrace{\begin{bmatrix} \dot{V} \\ \dot{\gamma} \\ \dot{\alpha} \\ \dot{q} \\ \dot{h} \\ \dot{x} \\ \dot{x}(t) \end{bmatrix}}_{\dot{\mathbf{x}}(t)} = \underbrace{\begin{bmatrix} X_V - \frac{X_{\dot{\alpha}} \cdot Z_V}{Z_{\dot{\alpha}} - 1} & \frac{g}{V_0} \sin \gamma_0 \cdot \frac{X_{\dot{\alpha}}}{Z_{\dot{\alpha}} - 1} - g \cos \gamma_0 & X_{X_\alpha} - \frac{X_{\dot{\alpha}} \cdot Z_\alpha}{Z_{\dot{\alpha}} - 1} & \frac{Z_q \cdot X_{\dot{\alpha}} + X_{\dot{\alpha}} + X_q - X_q \cdot Z_{\dot{\alpha}}}{1 - Z_{\dot{\alpha}}} & X_h - \frac{X_{\dot{\alpha}} \cdot Z_h}{Z_{\dot{\alpha}} - 1} & 0 \\ \frac{Z_V}{Z_{\dot{\alpha}} - 1} & \frac{g}{V_0} \sin \gamma_0 \cdot \frac{1}{1 - Z_{\dot{\alpha}}} & \frac{Z_\alpha}{Z_{\dot{\alpha}} - 1} & \frac{Z_{\dot{\alpha}} + Z_q}{Z_{\dot{\alpha}} - 1} & \frac{Z_h}{Z_{\dot{\alpha}} - 1} & 0 \\ -\frac{Z_V}{Z_{\dot{\alpha}} - 1} & \frac{g}{V_0} \sin \gamma_0 \cdot \frac{1}{Z_{\dot{\alpha}} - 1} & \frac{-Z_\alpha}{Z_{\dot{\alpha}} - 1} & \frac{Z_q + 1}{1 - Z_{\dot{\alpha}}} & \frac{-Z_h}{Z_{\dot{\alpha}} - 1} & 0 \\ M_V - \frac{M_{\dot{\alpha}} \cdot Z_V}{Z_{\dot{\alpha}} - 1} & \frac{g}{V_0} \sin \gamma_0 \cdot \frac{M_{\dot{\alpha}}}{Z_{\dot{\alpha}} - 1} & M_\alpha - \frac{M_{\dot{\alpha}} \cdot Z_\alpha}{Z_{\dot{\alpha}} - 1} & \frac{Z_q \cdot M_{\dot{\alpha}} + M_{\dot{\alpha}} + M_q - M_q \cdot Z_{\dot{\alpha}}}{1 - Z_{\dot{\alpha}}} & M_h - \frac{M_{\dot{\alpha}} \cdot Z_h}{Z_{\dot{\alpha}} - 1} & 0 \\ \sin \gamma_0 & V_0 \cos \gamma_0 & 0 & 0 & 0 & 0 \\ \cos \gamma_0 & -V_0 \sin \gamma_0 & 0 & 0 & 0 & 0 \end{bmatrix}}_A \cdot \underbrace{\begin{bmatrix} V \\ \gamma \\ \alpha \\ q \\ h \\ x \\ x(t) \end{bmatrix}}_{\mathbf{x}(t)} + \underbrace{\begin{bmatrix} X_\eta - \frac{X_{\dot{\alpha}} \cdot Z_\eta}{Z_{\dot{\alpha}} - 1} & X_{\delta_T} - \frac{X_{\dot{\alpha}} \cdot Z_{\delta_T}}{Z_{\dot{\alpha}} - 1} \\ \frac{Z_\eta}{Z_{\dot{\alpha}} - 1} & \frac{Z_{\delta_T}}{Z_{\dot{\alpha}} - 1} \\ \frac{Z_\eta}{Z_{\dot{\alpha}} - 1} & \frac{Z_{\delta_T}}{Z_{\dot{\alpha}} - 1} \\ 1 - Z_{\dot{\alpha}} & 1 - Z_{\dot{\alpha}} \\ M_\eta - \frac{M_{\dot{\alpha}} \cdot Z_\eta}{Z_{\dot{\alpha}} - 1} & M_{\delta_T} - \frac{M_{\dot{\alpha}} \cdot Z_{\delta_T}}{Z_{\dot{\alpha}} - 1} \\ 0 & 0 \\ 0 & 0 \end{bmatrix}}_B \cdot \underbrace{\begin{bmatrix} \eta \\ \delta_T \\ \mathbf{u}(t) \end{bmatrix}}_{\mathbf{u}(t)}$$

$$X_V \approx -\frac{\bar{q}_0 S}{m V_0} \cdot \left[M_0 \cdot \frac{\partial C_D}{\partial M} \Big|_0 + 2C_{D|0} \right]$$

$$X_\alpha \approx \frac{\bar{q}_0 S}{m} \cdot [C_{L|0} - C_{D\alpha}]$$

$$X_q \approx -\frac{\bar{q}_0 S}{m} \cdot \frac{\bar{c}}{2V_0} \cdot C_{Dq}$$

$$X_h \approx -\frac{\bar{q}_0 S}{m \rho_0} \cdot \frac{\partial \rho}{\partial h} \Big|_0 \cdot C_{D|0}$$

$$X_{\dot{\alpha}} \approx -\frac{\bar{q}_0 S}{m} \cdot \frac{\bar{c}}{2V_0} \cdot C_{D\dot{\alpha}}$$

$$X_\eta \approx -\frac{\bar{q}_0 S}{m} \cdot C_{D\eta}$$

$$X_{\delta_T} \approx \frac{1}{m} \cdot \left[\frac{\partial (X_P)_B}{\partial \delta_T} \Big|_0 \cos \alpha_0 + \frac{\partial (Z_P)_B}{\partial \delta_T} \Big|_0 \sin \alpha_0 \right]$$

$$Z_V \approx -\frac{\bar{q}_0 S}{m V_0^2} \cdot \left[M_0 \cdot \frac{\partial C_L}{\partial M} \Big|_0 + 2C_{L|0} \right]$$

$$Z_\alpha \approx -\frac{\bar{q}_0 S}{m V_0} \cdot [C_{L\alpha} + C_{D|0}]$$

$$Z_q \approx -\frac{\bar{q}_0 S}{m V_0} \cdot \frac{\bar{c}}{2V_0} \cdot C_{Lq}$$

$$Z_h \approx -\frac{\bar{q}_0 S}{m V_0 \rho_0} \cdot \frac{\partial \rho}{\partial h} \Big|_0 \cdot C_{L|0}$$

$$M_\eta \approx \frac{1}{I_{yy}} \cdot \bar{q}_0 S \bar{c} \cdot C_{m\eta}$$

$$M_{\delta_T} \approx \frac{1}{I_{yy}} \cdot \frac{\partial M_P^G}{\partial \delta_T} \Big|_0$$

Thrust influence neglected

The Classic View on Flight Control

Linear Analysis – Eigenvalues: Aircraft Pitch Dynamics

Typical position of the Eigen Values of the longitudinal motion of a conventional aircraft in the complex plane:

Reference airplane and state data:

Airplane: DC 8
 Mach number: 0.443
 Velocity: 142,6464 [m/s]
 Weight: 86182,55 [kg]
 Altitude: 4,57200 [km]

- Two conjugate complex Eigen Value pairs
- Two periodic and stable Eigen motion forms
- The two periodic Eigen motion forms differ strongly concerning their

	Re(λ) [-]	Im(λ) [-]	ζ [-]	ω_0 [rad/s]
1	-0.0027447	0.089143	0.030776	0.089185
	-0.0027447	-0.089143	0.030776	0.089185
2	-1.043	2.1613	0.43462	2.3998
	-1.043	-2.1613	0.43462	2.3998

Long period (low frequency), weakly damped Phugoid mode (PH)

Short period (high frequency), strongly damped Short Period mode (SP)

The Classic View on Flight Control

Linear Analysis – Eigenvectors: Aircraft Pitch Dynamics

Short-period mode

	$ x $	$\arg(x)$ [°]
V*	0.0039838	-68.8305
γ	0.089972	-213.2013
α	0.28484	-97.5079
q	0.62121	0

Phugoid mode

	$ x $	$\arg(x)$ [°]
V*	0.41054	-267.7402
γ	0.53246	0
α	0.0094243	-84.4333
q	0.047576	-269.2439

⇒ The states pitch rate and angle of attack are the main factors in the Short-period mode

⇒ The states velocity and climb angle are the main factors in the Phugoid mode

The Classic View on Flight Control

Linear Analysis – Intuitively understanding the physics behind - aircraft pitch dynamics

For mastering real systems, correct math is a prerequisite – however not enough.

Failing to understand what the system is doing leads to failure in controlling it!

M_α corresponds to spring constant of a mass-spring-damper-system

M_q corresponds to damping coefficient of a mass-spring-damper-system

The Classic View on Flight Control

Control Objective – How should the aircraft behave? – Requirements

**EASA CS
22/23/25/27/29/
VLA/VLR
FAR
23/25/27/29/103**

requirements for flight
controllers as well as
accurateness
requirements for
autopilots“

**Secondary
literature**

(Papers, reports of
expert groups,
e.g. NATO RTO,
Garteur, ...)

The Classic View on Flight Control

Control Objective – How should the aircraft behave? – Requirements

Concerning the function of the aircraft it is allocated to one of the four classes:

Class I

Small, light airplanes

Class II

Medium-weight,
low-to-medium
maneuverability airplanes

Class III

Large, heavy,
low-to-medium
maneuverability airplanes

Class IV

High-maneuverability
airplanes

Nonterminal Flight Phases

Category A

Require rapid maneuvering, precision tracking, or precise flight path control

e.g.

- Air-to-air combat (CO)
- Ground Attack (GA)
- Aerial recovery (AR)
- Reconnaissance (RC)

Category B

Normally accomplished using gradual maneuvers and without precision tracking, although accurate flight-path control may be required

e.g.

- Climb (CL)
- Cruise (CR)
- Descent (D)
- Emergency Descent (ED)

Terminal Flight Phases

Category C

Normally accomplished using gradual maneuvers and usually require accurate flight-path control.

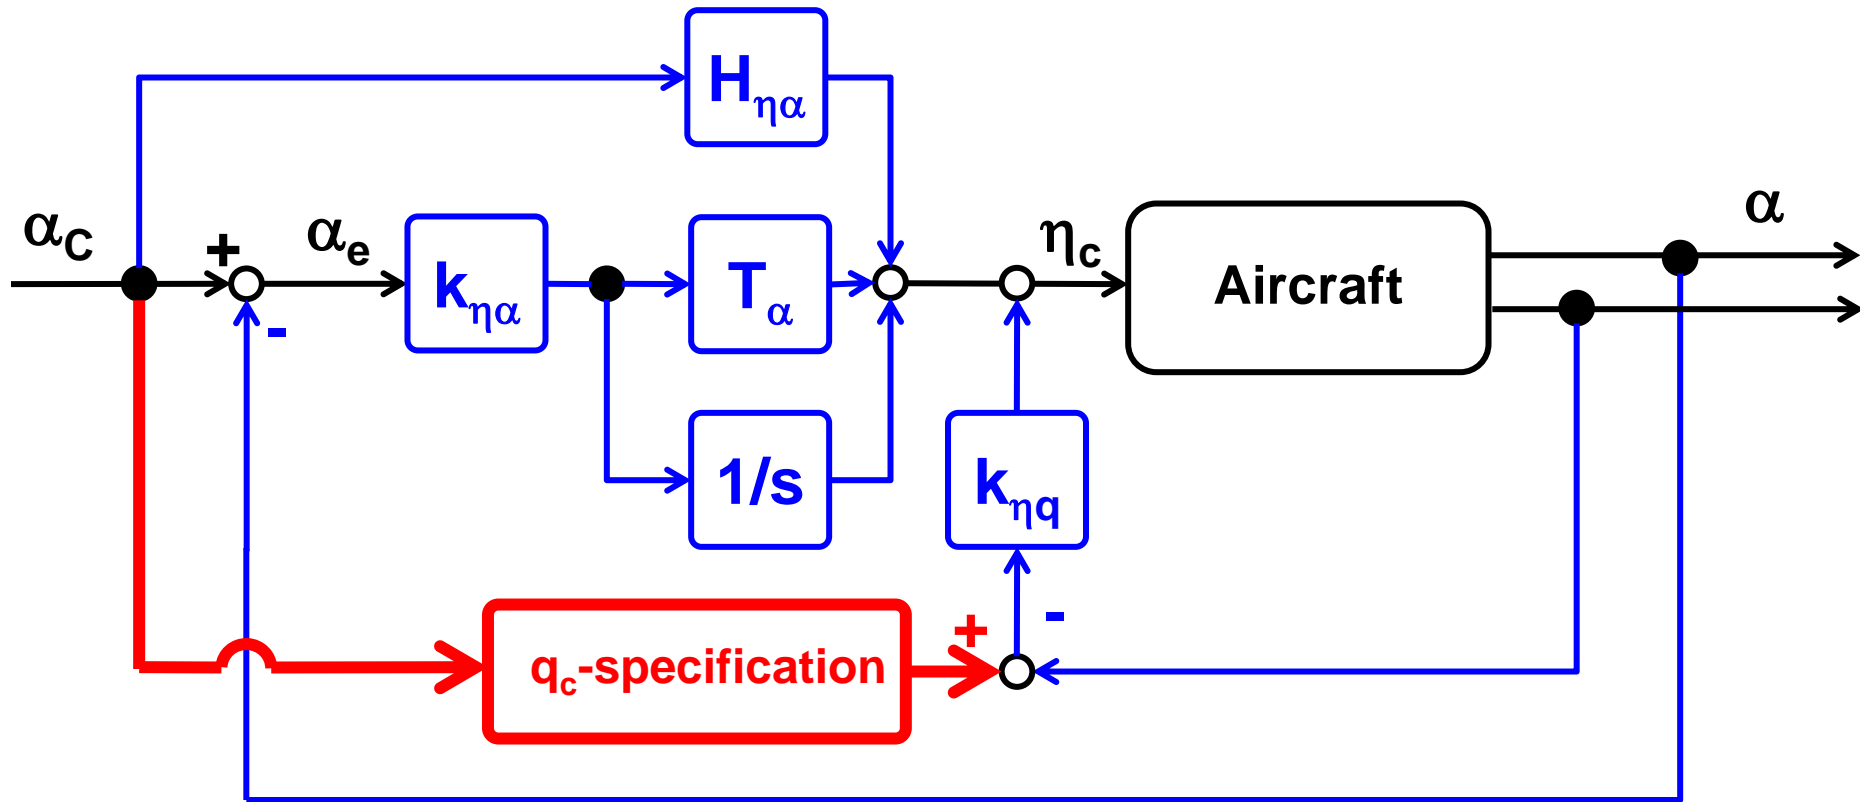

e.g.

- Takeoff (TO)
- Approach (PA)
- Landing (L)

The Classic View on Flight Control

Physically motivated choice of controller structure: Classic aircraft inner loop (CSAS)

Angle of attack command and stability augmentation system

q_c - specification:

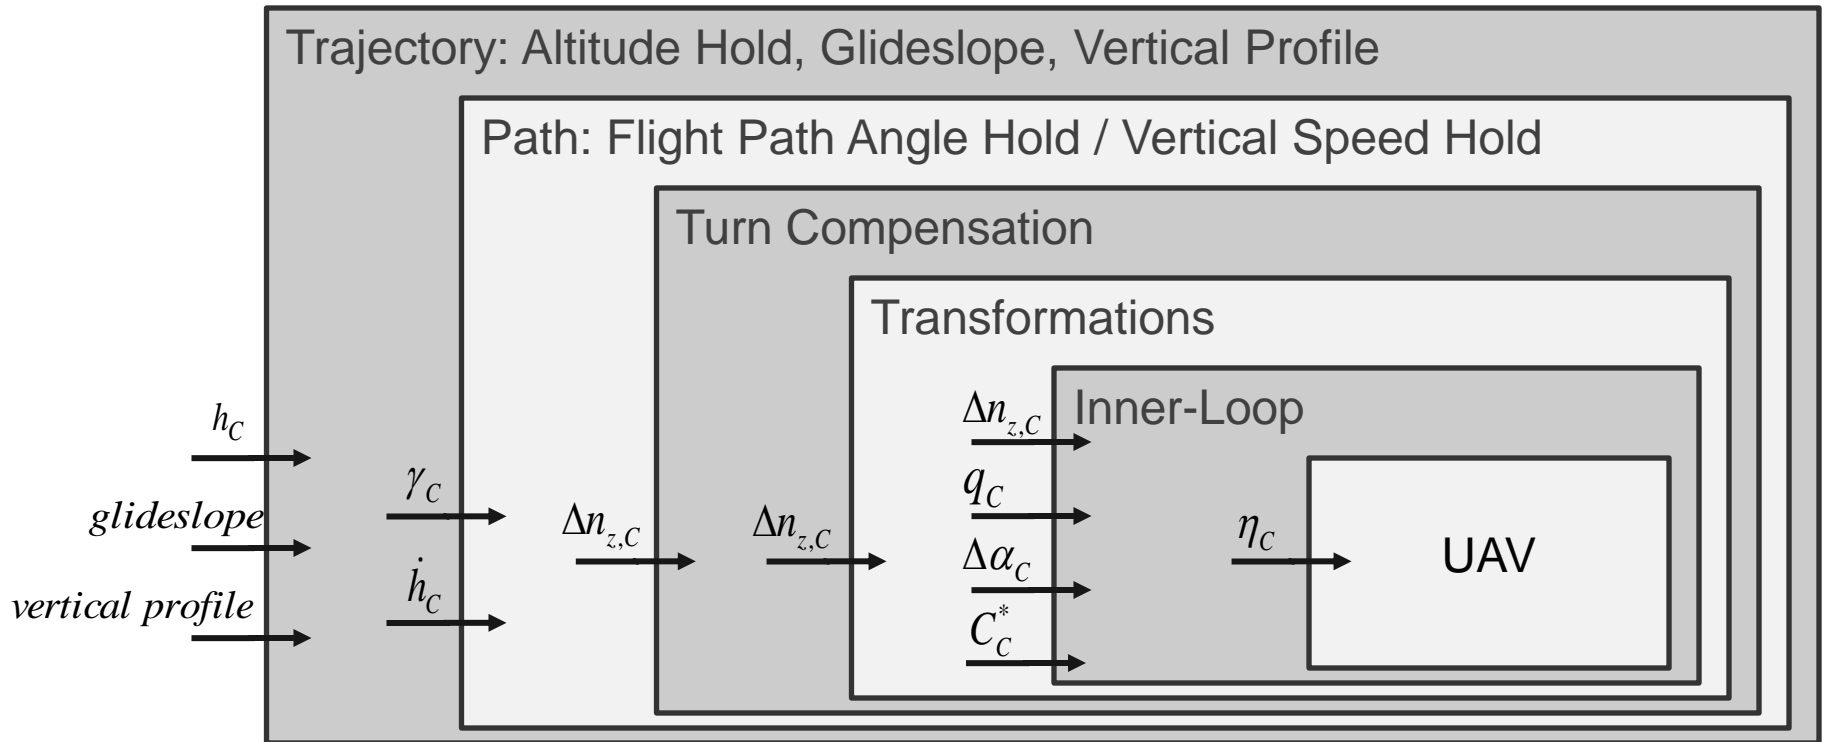

The pitch rate corresponding to the commanded α is computed.

The pitch damper is just feeding back the error in pitch rate, i.e. the deviation from the precomputed value.

By that it is ensured that the pitch damper will not fight the commanded maneuver.

The Classic View on Flight Control

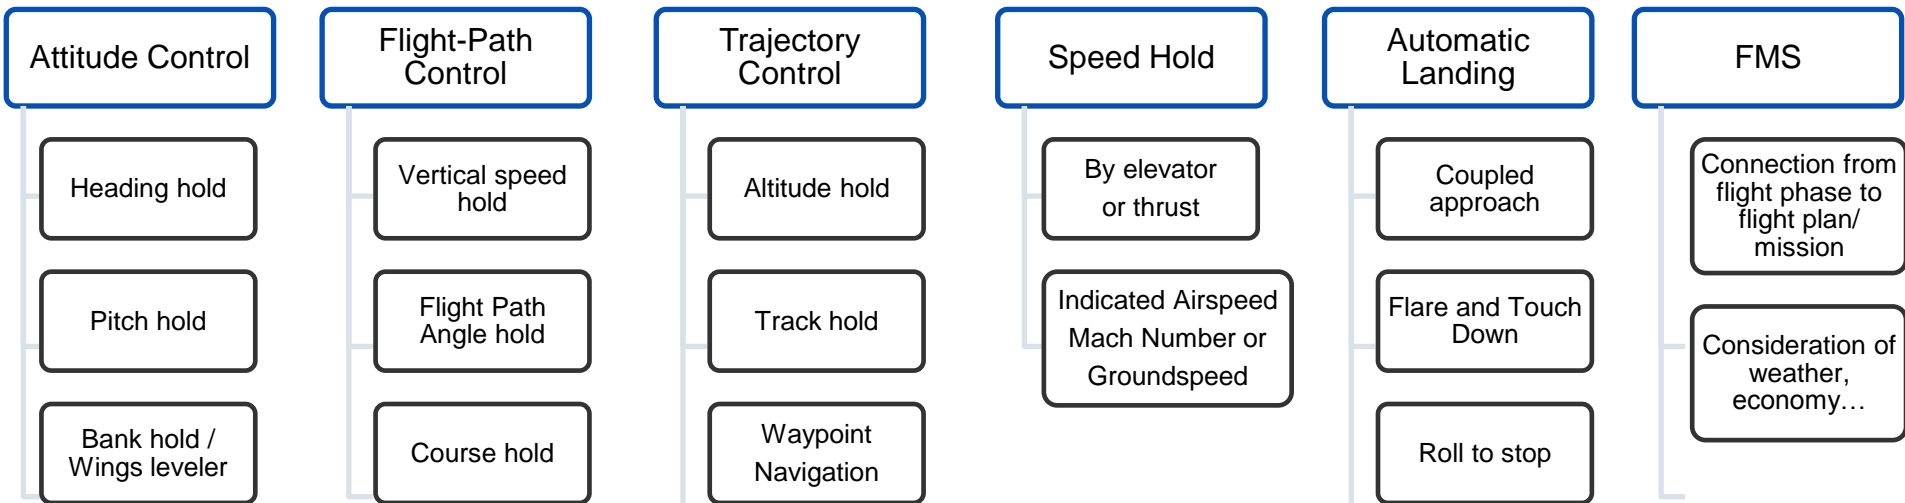

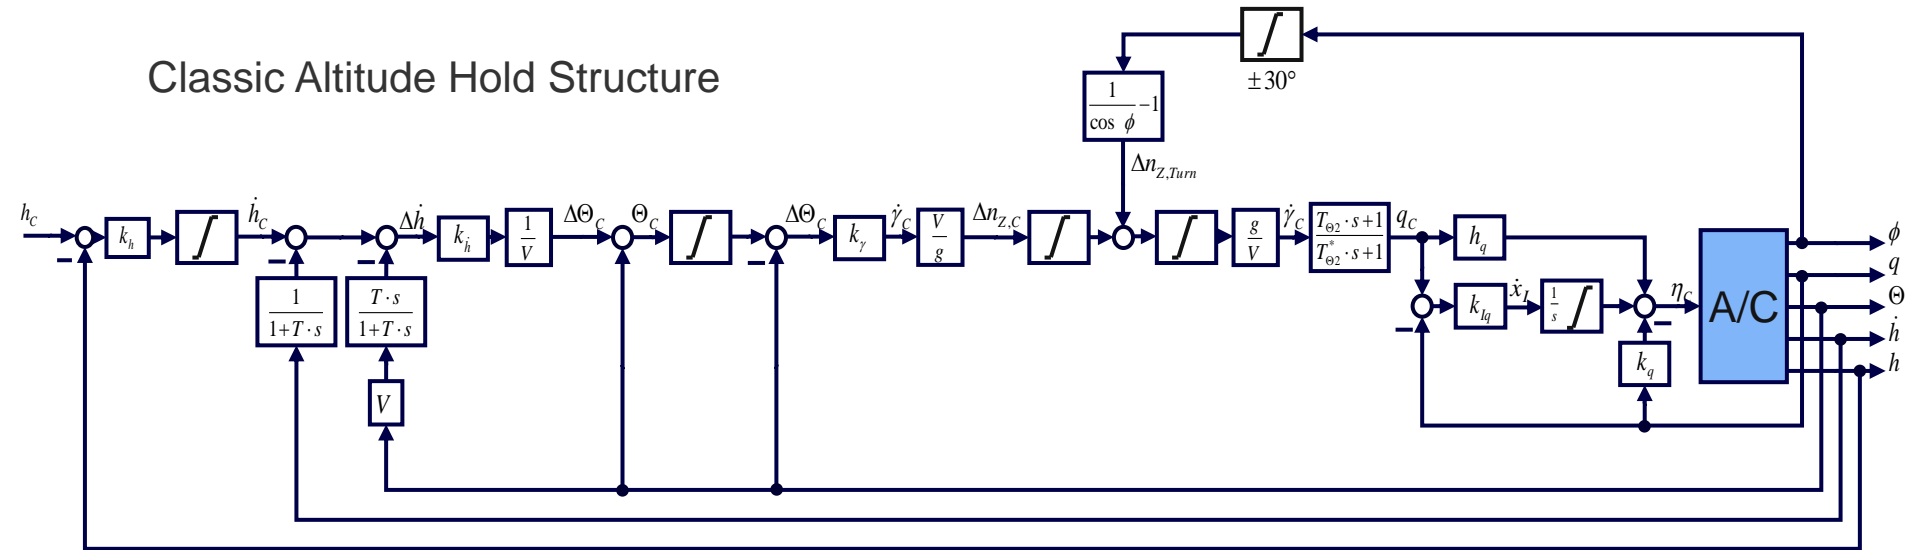

Hierarchical structure of classic autoflight systems: “Vertical plane control”

The Classic View on Flight Control

Hierarchical structure of classic autoflight systems: "Vertical plane control"

Classic Altitude Hold Structure

The Classic View on Flight Control

Designing the gains – choice of the control methodology

Analysis of open loop

- Time & frequency domain
- Eigenvalues / -vectors
- Pole zero distribution
- Stability, margins

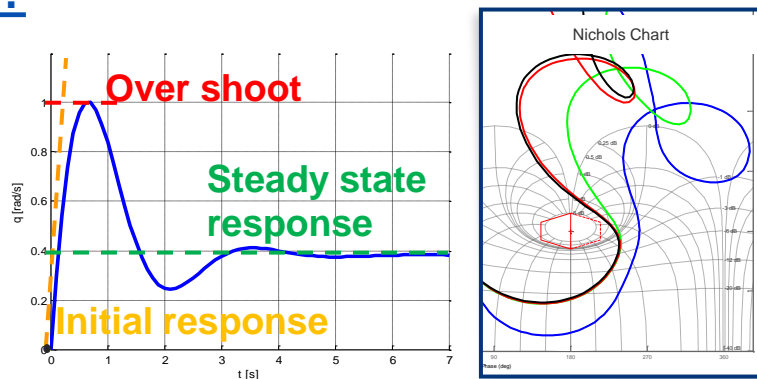

Gain design method

- Modal Control: SISO, MIMO pole placement, Eigenstructure assignment
- Optimal control: LQR / LQG
- Robust control: H-Infinity, Mu-Synthesis
- Multi objective parameter optimization

Closed loop criteria fulfilled ?

- Analysis and iterations
- Automation is a main issue!
- Not in a single point, but over the whole envelope

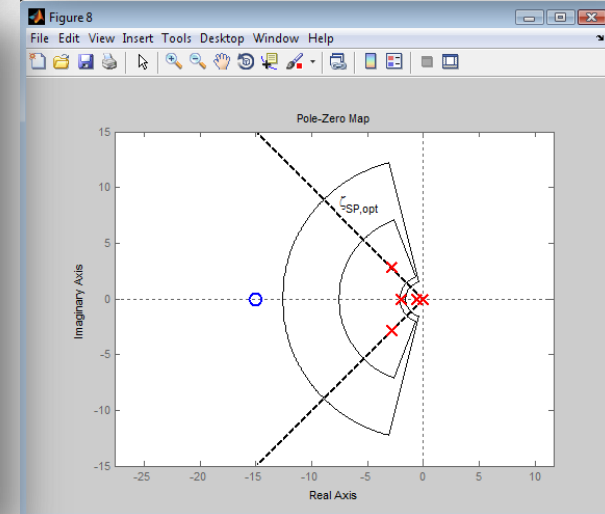

The Classic View on Flight Control

Designing the gains – automation of gain computation and closed-loop assessment

Manned Research

Unmanned Research

Making Visions Fly

Some thoughts on operational systems

- Failures lead to loss of money, property or life
- Public interest in safety \Rightarrow regulations („certification“)
- Operational systems need to be dependable
Dependability = Safety + Reliability + Availability + Integrity
 - Safety: a measure of the absence of catastrophic consequences on user and environment
 - Reliability: a measure of the systems continuity of correct service
 - Availability: a measure of the systems readiness for correct service
 - Integrity: a measure of the absence of improper system alteration
- Many ideas successfully demonstrated in proofs of concept never made it to real products
- The earlier showstoppers for real application are identified and mitigated, the higher the chance for real application is

Making Visions Fly

Consequences for development, implementation and operation of flying systems

- Given characteristics have to be guaranteed with a given probability
 - Adherence to these requirements must be proven and documented
 - There is a tremendous gap between “what can be done” and “what may be done”
 - The design is not driven by the nominal function but by failures
 - Available potential has to be sacrificed for the sake of testability and the possibility to give proofs
 - Very often, system performance is no longer the optimization goal – Required performance is boundary condition, operational robustness is optimization objective
 - The “math” may no longer be considered standalone – physics, algorithms and implementation need to be addressed in an integrated manner
- ⇒ Traditionally, these points have been addressed by evolutionary steps and growing experience
- ⇒ However, revolutionary new concepts like HAWE systems cannot build on legacy experience
- ⇒ New approaches to answer the questions above are required

Making Visions Fly

Appreciation for formalized development processes

Multi-domain systems:

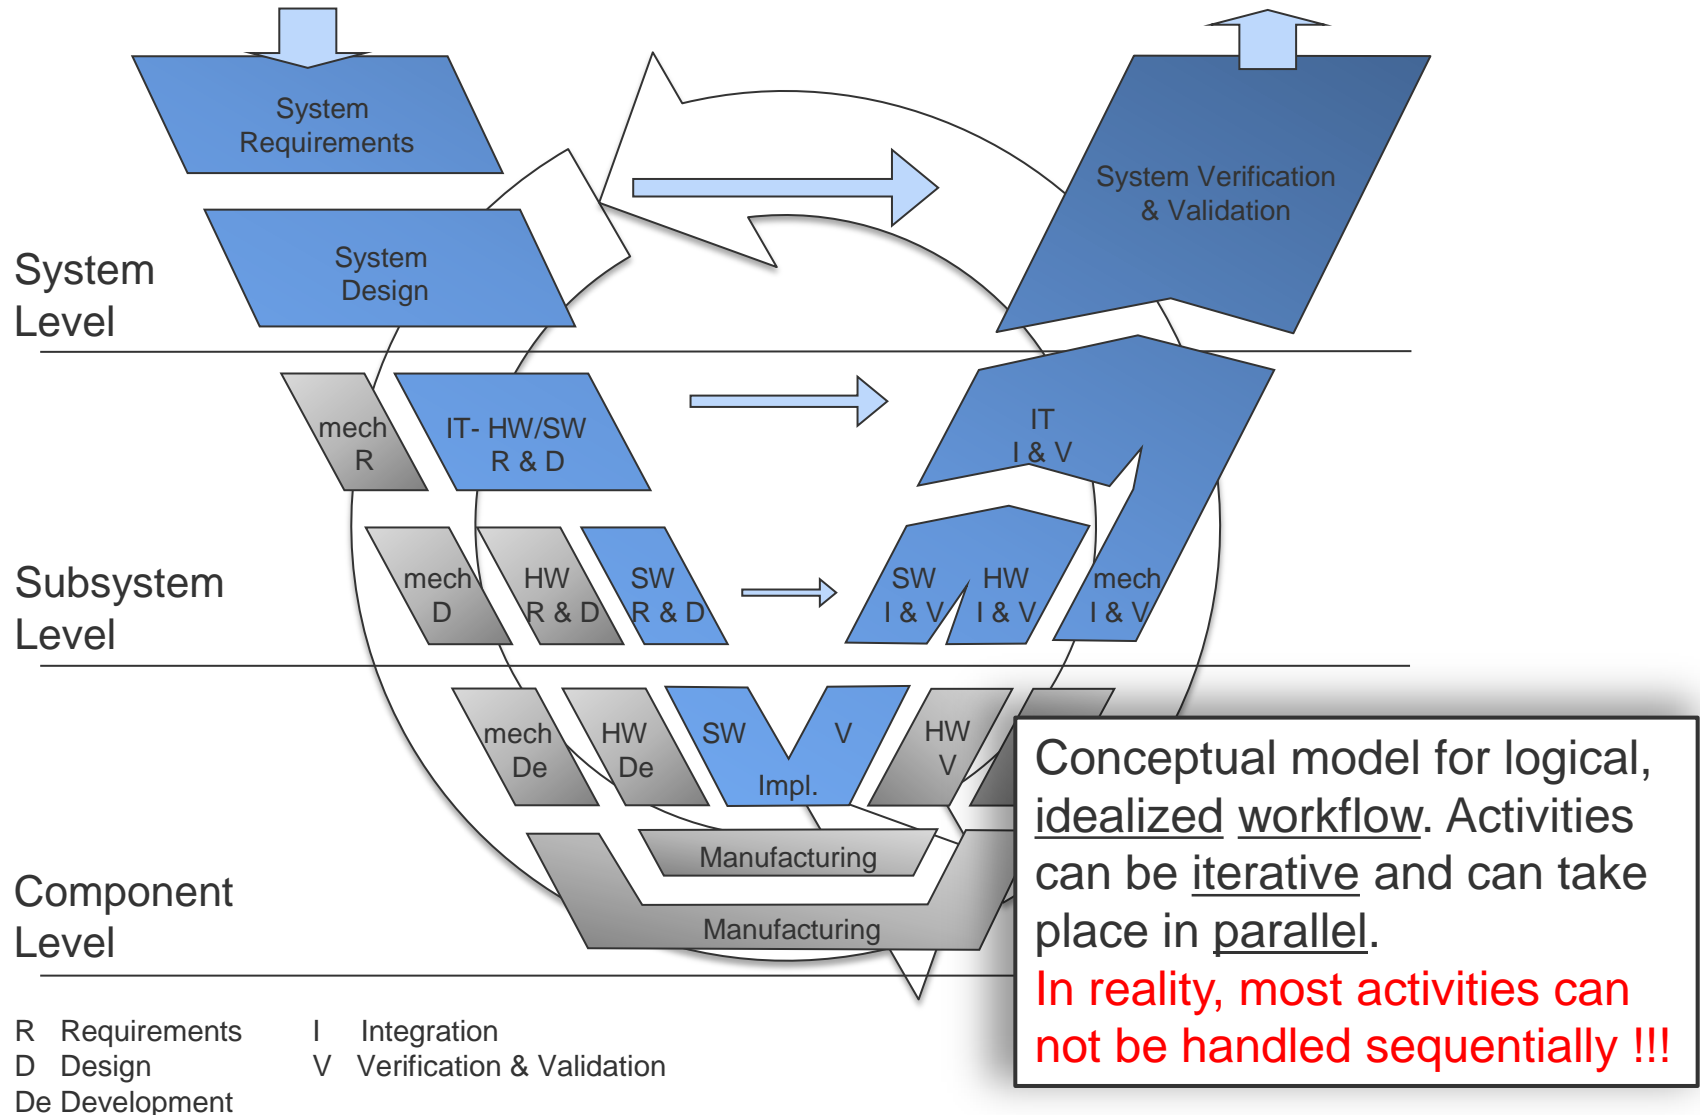

- System functionalities result from interactions between
 - **mechanical structures**,
 - **aircraft systems** (mechanic, hydraulic, electric, ...) and
 - **avionics** (hard- & software)
- Highly dynamic systems with multiple inputs and multiple outputs
- Hard real time systems

Approaches and methods in the different domains are dissimilar!
Every domain has specific and dissimilar methods, tools, ...

- The assessment of flight control systems can only be carried out on the whole, integrated, closed-loop system!
- A proper system design relies on early deployment of a proper safety assessment process, so that possible failure modes are identified and treated in the design.

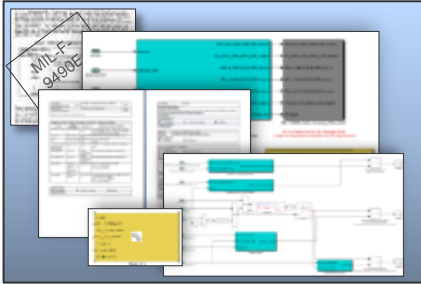

Making Visions Fly

**Target Specific
Code Models
(Graphical Programming)**

Making Visions Fly

Requirements – What do we want to develop

- Before developing something, the objectives and goals must be clear, complete, unique and non-contradictory
- It needs to be quantified before development of the system
 - What the design goal is (“Desired Performance”)
 - What is considered as acceptable (“Adequate Performance”)
 - How compliance is to be demonstrated (“Acceptable Means of Compliance”)
- Therefore, all requirements must be quantified and formalized to be testable
- Normally, everybody considers functional requirements – however, there’s much more:
 - Operational Requirements
 - Environmental Requirements
 - Safety Requirements
 - Many Derived Requirements (depending on the design)
 - ...

Making Visions Fly

Requirements Formulation for High Altitude Wind Energy Systems

- Handling qualities are well-known & established requirements for designing flight control algorithms in manned flight but **not applicable** to unmanned aerial vehicles!
- Absence of flight dynamics and stability requirements for design of flight control algorithms for UAV's and thus HAWE's
- High Altitude Wind Energy Systems arise a complete new domain of flying systems, so **where to get the requirements?**

Approach:

- Probabilistic Analyses in consideration of system uncertainties and typical stochastic systems errors (e.g. GPS position)
- Validation of high-level requirements w.r.t. flight dynamics and flight control
- Formulation of **physically meaningful** and **consistent** requirements for flight controller design of HAWE's respecting inherent aircraft dynamics

Making Visions Fly

Trajectory Optimization for Solar Aircraft

- How to operate a new system in a way that it delivers the maximum outcome?

⇒ Optimization Problem!

Example: Solar Aircraft

- Trajectory Optimization leads to optimal solutions under nominal conditions but is prone to disturbances and environmental influences

⇒ Helpful to get a first “feeling” for the system

Making Visions Fly

High Level Design Objectives

Identification of the high level design objectives of a HAWE-System leads to:

Optimization with respect to **Availability!**

Boundary Conditions:

- ⇒ Generation of a specific power output
- ⇒ Under given safety requirements

Availability means less sensitivity to disturbances and external influences!

Optimization under consideration of:

- ⇒ Flight phases during normal and emergency operation
- ⇒ Environmental conditions and influences
- ⇒ Failure scenarios
- ⇒ System and component specific behavior
- ⇒ Future certification

Why?

In early stages of the development life cycle information on aircraft rarely exists.

Most often requirements to subsystems of an aircraft (e.g. sensors, actuators, flight control system) are stated and quantified based on **assumptions** using expertise from prior projects or engineering judgement.

Overview about **interdependence** of requirements and their **consistency** and **correctness** can hardly be gained.

What?

Derivation of **physically motivated, quantified** and **consistent requirements** for aircraft subsystems and flight control.

How?

Simplified **mathematical descriptions** of aircraft flight dynamics including generic and aircraft specific information

Making Visions Fly

Models for Requirements Determination

Flight mechanics models are powerful tools for determination of requirements in different stages of product development process and in different engineering domains.

Flight dynamics and systems specification:

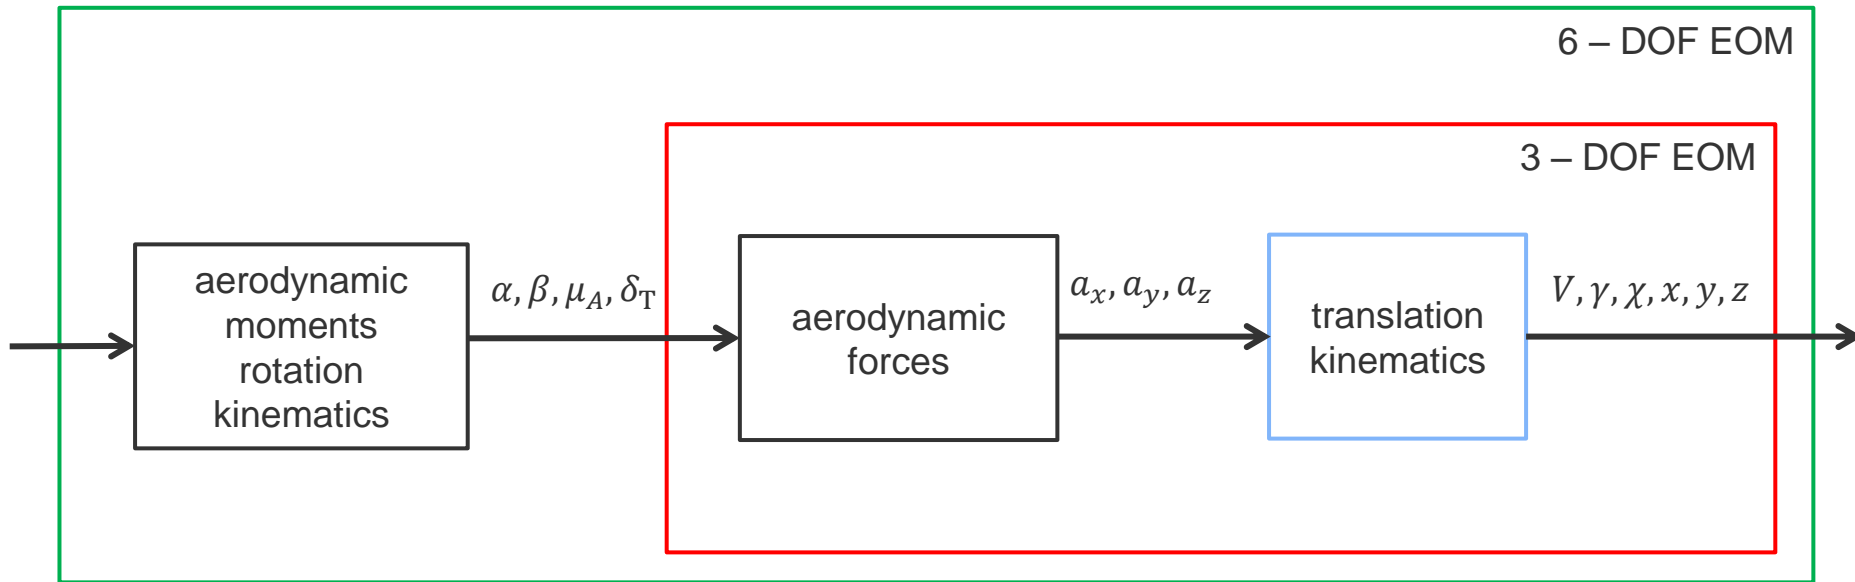

- stability and performance analysis
- specification of subsystems performance (sensors, actuators, propulsion system)
- weight & balance (bookkeeping)
- envelope determination
- ...

Flight control system specification

- specification of envelope protections and limitations
- specification of performance requirements
- specification of closed-loop behavior
- ...

Making Visions Fly

Evolution of Requirements Models

Modular approach:

- 1 Start deriving requirements using kinematic models
- 2 Enrich your model with aircraft specific data (weight and balance, actuators, bank angle limitations)
- 3 Enrich your model with aerodynamics, and subsystems dynamics as soon as aerodynamic data is available
- 4 Build 6-DOF model, trim and linearize the aircraft motion and use linear approximations or nonlinear system for further investigations

Making Visions Fly

Application of (kinematic) Requirements Models

Probabilistic analyses

- Perturbation of initial conditions and system errors (e.g. position of flare initiation)
- Perturbation of closed-loop dynamics
- Overlapping of errors and simulation of resulting probabilities

Preliminary requirements determination

- Determination of touch-down point
- Determination of touch down velocity
- Influence of sensor errors on flown trajectory
- Sensor accuracy determination
- Specification of closed loop dynamics

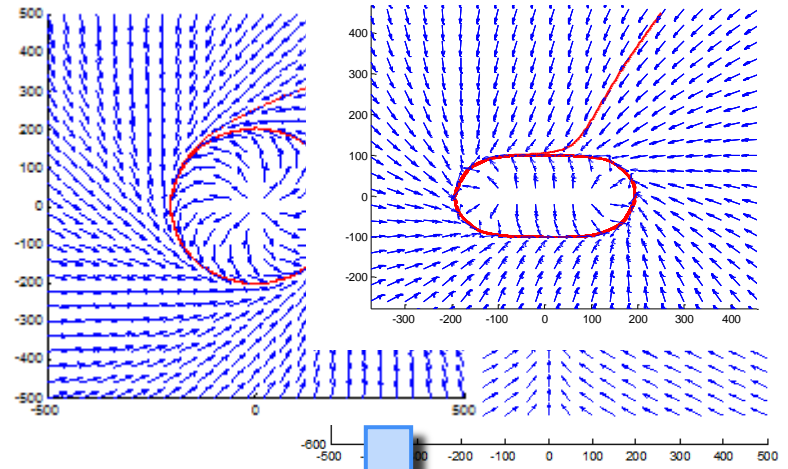

Making Visions Fly

Trajectory Specification with Augmented Simulation Models

Specification of minimum waypoint distance for different velocities and actuator dynamics using kinematic models

Waypoint planning e.g. using vector fields

Trajectory specification using flight dynamics models

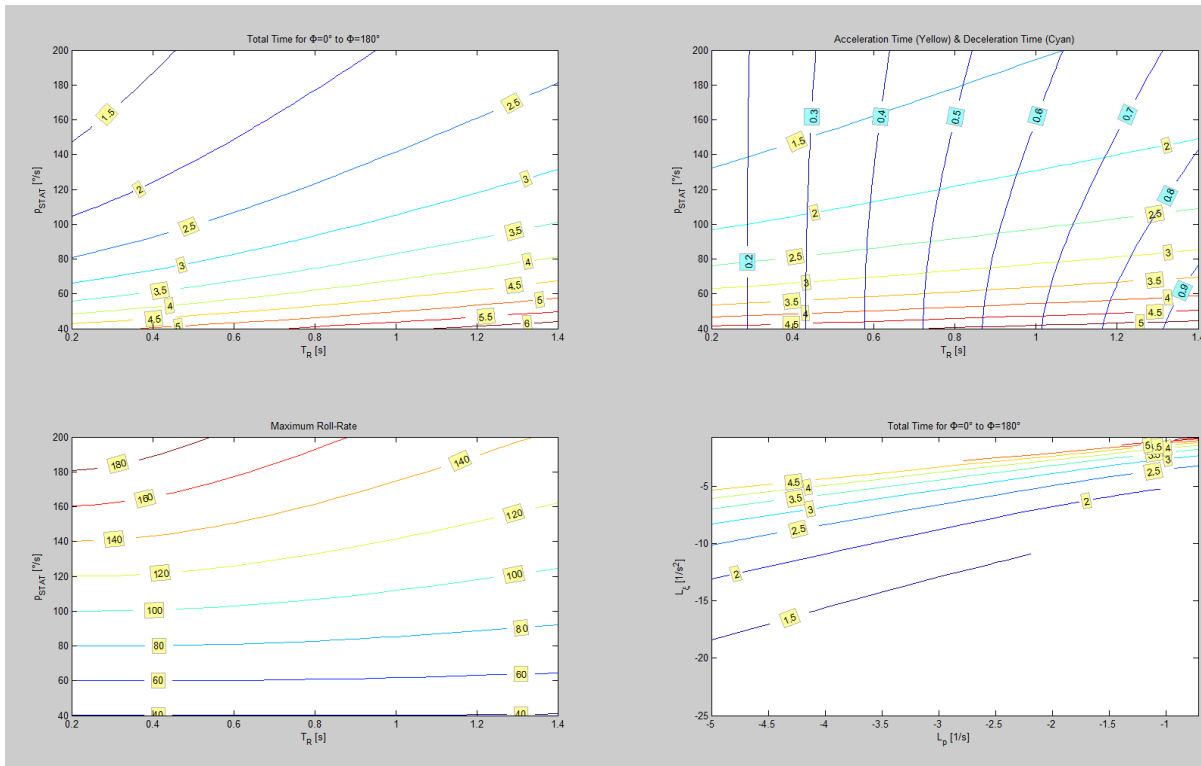

Making Visions Fly

Linear State Space Models (Application Example 1)

Simple linearized approximations of aircraft motion can be used for e.g.:

- Validation of performance requirements (Example: Roll to 180° within 2 seconds)
- Linear system $\dot{p} = L_p p + L_\xi \xi$
 $\dot{\Phi} = p$
- Results time constant for roll motion compliant with requirement

Making Visions Fly

Linear State Space Models (Application Example 2)

Simple linearized approximations of aircraft motion can be used for e.g.:
 Derivation of actuator parameters and aerodynamic effectors for stabilization of unstable yaw motion

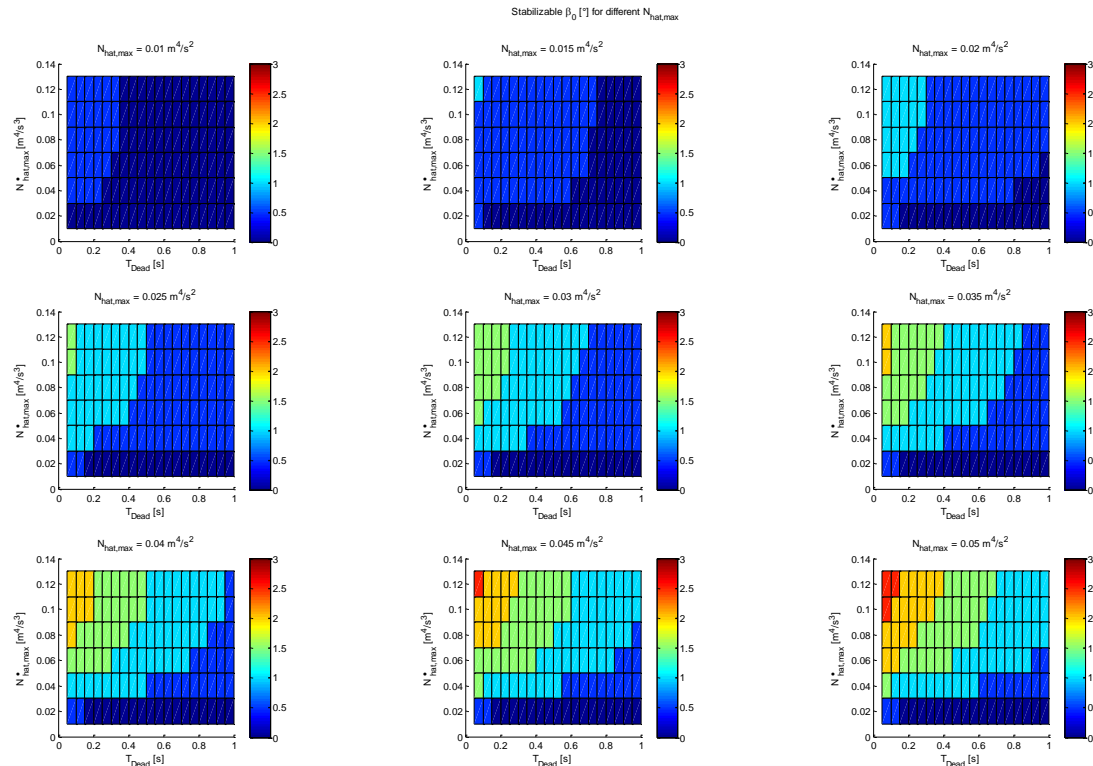

- Linear system

$$\dot{r} = N_r r + N_\beta \beta + N_\zeta \zeta$$

$$\dot{\beta} = r$$

- Results

$$N_{\zeta_{MAX}}, \dot{N}_{\zeta_{MAX}}, \beta_{0_{MAX}}, T_{delay} \text{ (actuator)}$$

Making Visions Fly

Nonlinear 6-DOF Models (Application Example)

Trim curves for different flight conditions are useful for determination of **flight envelope**, **envelope limitations** and **optimum flight conditions**

Climbing Flight @ const throttle:
Plot of γ over velocity and altitudes

Level Flight: Envelope of constant power demand

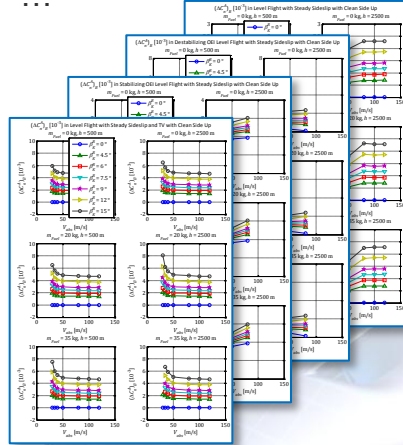

Making Visions Fly

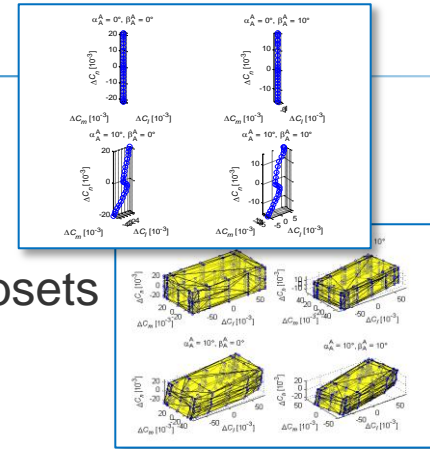

Functional Controls Layout & Assessment

- High-Level Requirements: - E.g., it should be possible to take-off and land with up to 10 kts cross wind

Trim curve and performance analysis for a set of generic controls

- Attainable Moment Subsets (AMS)

Controls Concept

Control Allocation

Controls Re-Design

Controls Re-Design

Trim curve & performance analysis, stabilization assessment

- Control Authority Requirements

Controls Layout

- Controls Demand & Requirement's Compliance

- One main effector for each axis
- Split/Schedules ...

Making Visions Fly

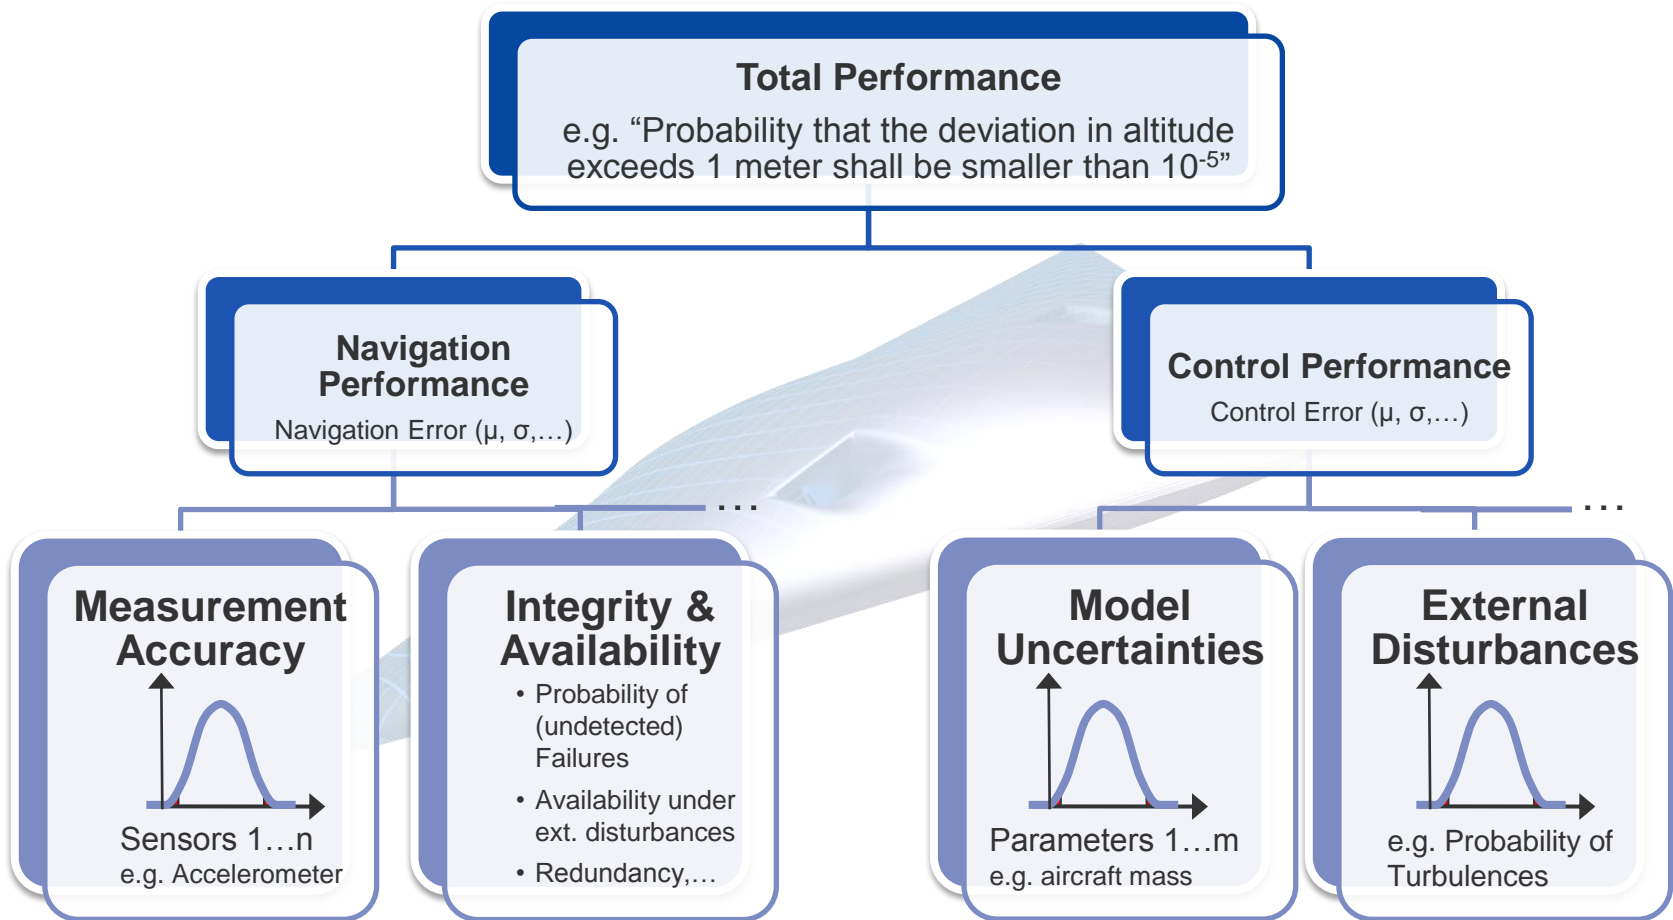

Total System Capability Approach: Idea & Methodology

- Overall system is required to deliver a certain performance
- Behavior of integrated system is driven by all contributing elements
 - ⇒ e.g. Sensors, Actuators, Computers, Disturbances,...
- Instead of allocating hard tolerance budgets to the individual disciplines
 - ⇒ Consideration of the overall system simultaneously
- Certain Performance required to provide a Safe System / Operation
 - ⇒ Using quantitative analyses, probability of undesired Failure Conditions can be calculated
 - ⇒ The more severe a Failure Condition is, the lower the risk for its occurrence is required

Making Visions Fly

Total System Capability Approach: Decomposition Tree

Making Visions Fly

Total System Capability Approach for Image Aided Landing

- Prediction example for longitudinal touchdown point
- Based on known distributions of relevant variables the numerical probability of a runway overrun can be calculated

Narrow runway,
Wide wheel track

Wide runway,
Narrow wheel track

- Formulate requirements
 - with respect to total deviation
 - related to actual situation & environment
- Define safety driven alert levels to meet safety goals
- Predict system performance statistics online
- Compare performance prediction to alert level
- System only useful if resulting availability is high

Making Visions Fly

Sensitivity Analysis of Environmental Influences

How is the system influenced by changes of **external parameters**?

- ⇒ Environmental conditions
 - ⇒ Static atmosphere: temperature, pressure, density
 - ⇒ Dynamic atmosphere: wind, gust, turbulence
 - ⇒ Precipitation (rain, snow, hail, icing)
- ⇒ System effects not accounted for in modeling
 - ⇒ Tether artefacts (vibration, stiffness, expansion etc.)
 - ⇒ Higher order dynamics
 - ⇒ ...
- ⇒ Foreign objects (bird strike, ...)

And how can those influences be considered with respect to their impact on the **Availability** as the global optimization parameter?

- ⇒ **Sensitivity analysis**

Making Visions Fly

Wind Speed Sensitivity Analysis – Sagitta ATOL

Crab Angles and Linear Impulse on Landing Gear during Landing:

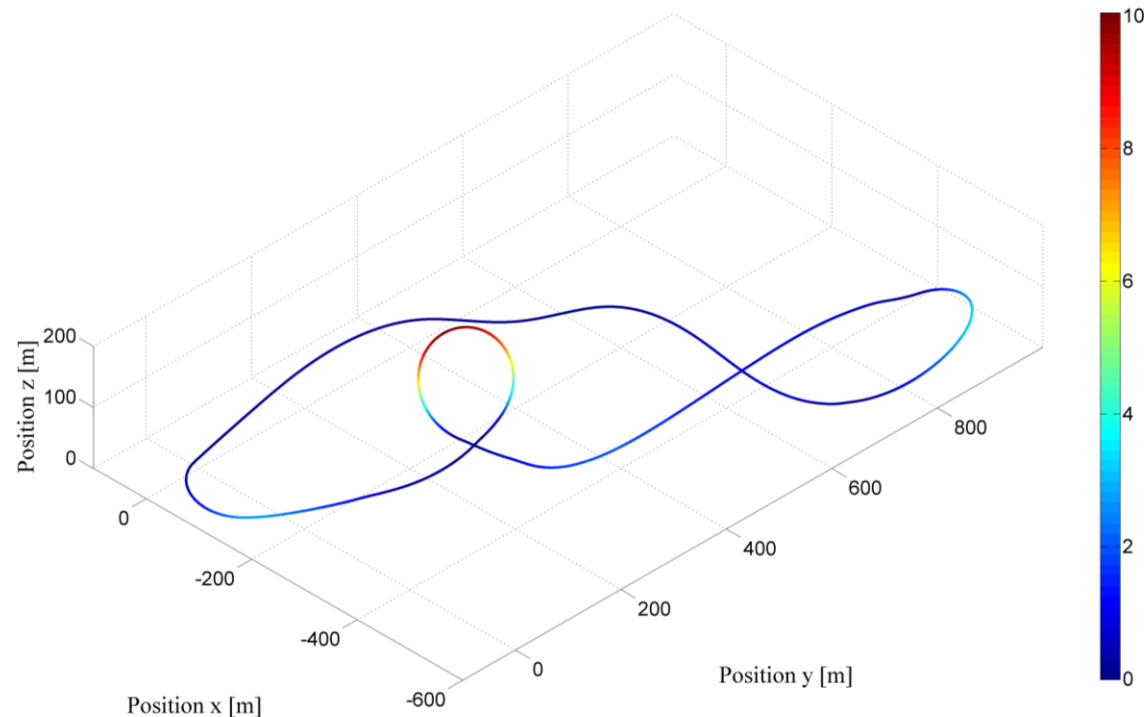

- Final approach with
 - mass $m = 100$ kg
 - constant path slope -9% (TLR)
 - $\Rightarrow \gamma_K \approx 5^\circ$
 - constant $V_{A,abs}$
 - $V_{K,abs}$ depends on wind conditions
 - Head / tail wind up to 15 kts (TLR)
 - $\Rightarrow u_W \in [-7.7, 7.7]$ m/s
 - Cross wind up to 10 kts (TLR)
 - $\Rightarrow v_W \in [-5.1, 5.1]$ m/s
- \Rightarrow Crab angle β_K , sink rate \dot{h} and lateral linear impulse p_{LAT} w.r.t. $V_{A,abs}$, u_W and v_W

Making Visions Fly

Wind Speed Sensitivity Analysis – Red Bull AirRace Trajectory Optimization

Sensitivity analysis of the nominal trajectory against disturbances

⇒ Sensitivity measure:

$$\frac{ds^i}{dp}(p_0) = \sqrt{\left(\frac{dx^i}{dp}(p_0)\right)^2 + \left(\frac{dy^i}{dp}(p_0)\right)^2 + \left(\frac{dz^i}{dp}(p_0)\right)^2}$$

⇒ Displacement of optimal trajectory in respect to wind speed!

Making Visions Fly

Flight phase dependent requirements

From functional considerations to the **Storybook of Flight**

– Operational phases and their requirements

Identification of

- Different flight phases of the system
- Their boundary conditions
- Initialization and initial values (especially for simulation and computer based optimization)
- Entry and exit criteria
- Phase transition criteria
- Non-Nominal flight phases:
 - ⇒ Failure recovery
 - ⇒ Emergency situations
 - ⇒ Degraded and alternate operational modes

Every flight phase needs its Requirements!

Making Visions Fly

Consideration of Flight Phases - Automatic Take Off and Landing

Functions and Moding for Nominal Landing Maneuver (Example)

Making Visions Fly

Flight Phase dependent Requirements for HAWK Systems

Exemplary requirements for kite based systems:

Phase	Lateral	Vertical	Speed	Systems
Start / Launch				
Acceleration				
Transition				
Power Generation Phase				
Transition to Hover				
Depower / Folding				
Reel In				
Transition and Deceleration				
Hover				
Reel In				
Dock / Locking				

Requirements Engineering

- Top-Down process: **formulation** and **formalisation** of High-Level requirements down to Low-Level software and hardware requirements
- Requirement-Standards:
 - ⇒ Verifikation
 - ⇒ Traceability
 - ⇒ Testability
 - ⇒ Reusability

or:

How to make sure that no requirement is left open and the system does what it shall do...

Making Visions Fly

DA42AP-001

(03_1.)

Altitude Select & Hold

(03_2.)

Derived From:

Functional Description

(03_3.)

Requirement Formulation

Altitude Capture: When the difference between aircraft altitude and selected altitude is within a later defined boundary the mode changes from Altitude Acquire (AA) to Altitude Hold (AH).

Requirement Definition:

(03_4.)

An Altitude Select & Hold functionality shall be implemented. It shall consist of three modes:

Altitude Acquire: The Altitude Acquire functionality takes the desired altitude and approaches the reference altitude by climbing with a constant rate.

Altitude Capture: When the difference between aircraft altitude and selected altitude is within a later defined boundary the mode changes from Altitude Acquire (AA) to Altitude Hold (AH).

Altitude Hold: This function... maneuver. The Altitude H...

Boundary

Variables and their Validity Boundaries for Altitude Select and Hold

Variable	Validity Boundaries	Reference	Justification of Validity Boundaries
Altitude	[200, 18 000] ft	3, page 57	a) Altitude > 200ft for departure and climb b) Max. demonstrated altitude is 18000ft
Airspeed	[90, 180] KIAS	3, page 57	operation range desired by the customer
Mass	[1250, 1785] kg	3, page 48	MTOM = Mass _{max} = 1785
X-Position of center of gravity	[2.35, 2.49] m	3, page 49	There are intermediate limitations that depend on mass
Bank angle	[-30, 30] °	MIL 9490D	The accuracy defined by MIL 9490D depends on the actual bank angle
Flap position	Up: [0, 2] ° Approach: [18, 24] ° Landing: [41, 45] °	4, page 2	a) Moving range includes tolerances b) V _{max,landing} : 113 KIAS c) V _{...} : 133 KIAS

Intention: To ensure q

The screenshot shows a software interface for requirement management. A dropdown menu is open, showing a list of categories: Performance, Accuracy, Stability, Design, Limitations, Safety/Reliability, Protections, Maintainability, Usability/HMI, Logic/States, and <Input Other>. The selected category is 'Performance'. The main window displays details for requirement R-FC-WS09 DA42AP-001.02. The 'Description/Quantification' is 'Increment normal acceleration: Er shall not result in an incremental r'. The 'Derived from' is 'MIL-F-9490D 3.1.2.5'. The 'Validation Status' is 'not accepted'. The 'Validation Remarks' are 'None'. The 'Mean of Compliance' is 'Simulation'. The 'Check Mechanism' is 'Off-Line Comparison'. The 'Input Matrix' table is as follows:

Variable	Signal Range and Increment Size	Justification of chosen signal range and Size
Altitude of the Aircraft	[200:50:18 000] ft	Maximum operating range
Altitude CMD	[200:50:18000]ft	Maximum values specified for the altitude hold functionality
Airspeed	[90:10:180] KIAS	Operation range of the Autopilot
Bank angle	[-30:1:30]°	Engagement of the functionalities shall be tested for the whole possible range.
Vertical Speed	[0:10:2000]fpm	Test Range for the actual requirement
AH Mode	[0:1]	Engagement of the AH Mode is needed to verify the Requirement

The 'Output Matrix' table is as follows:

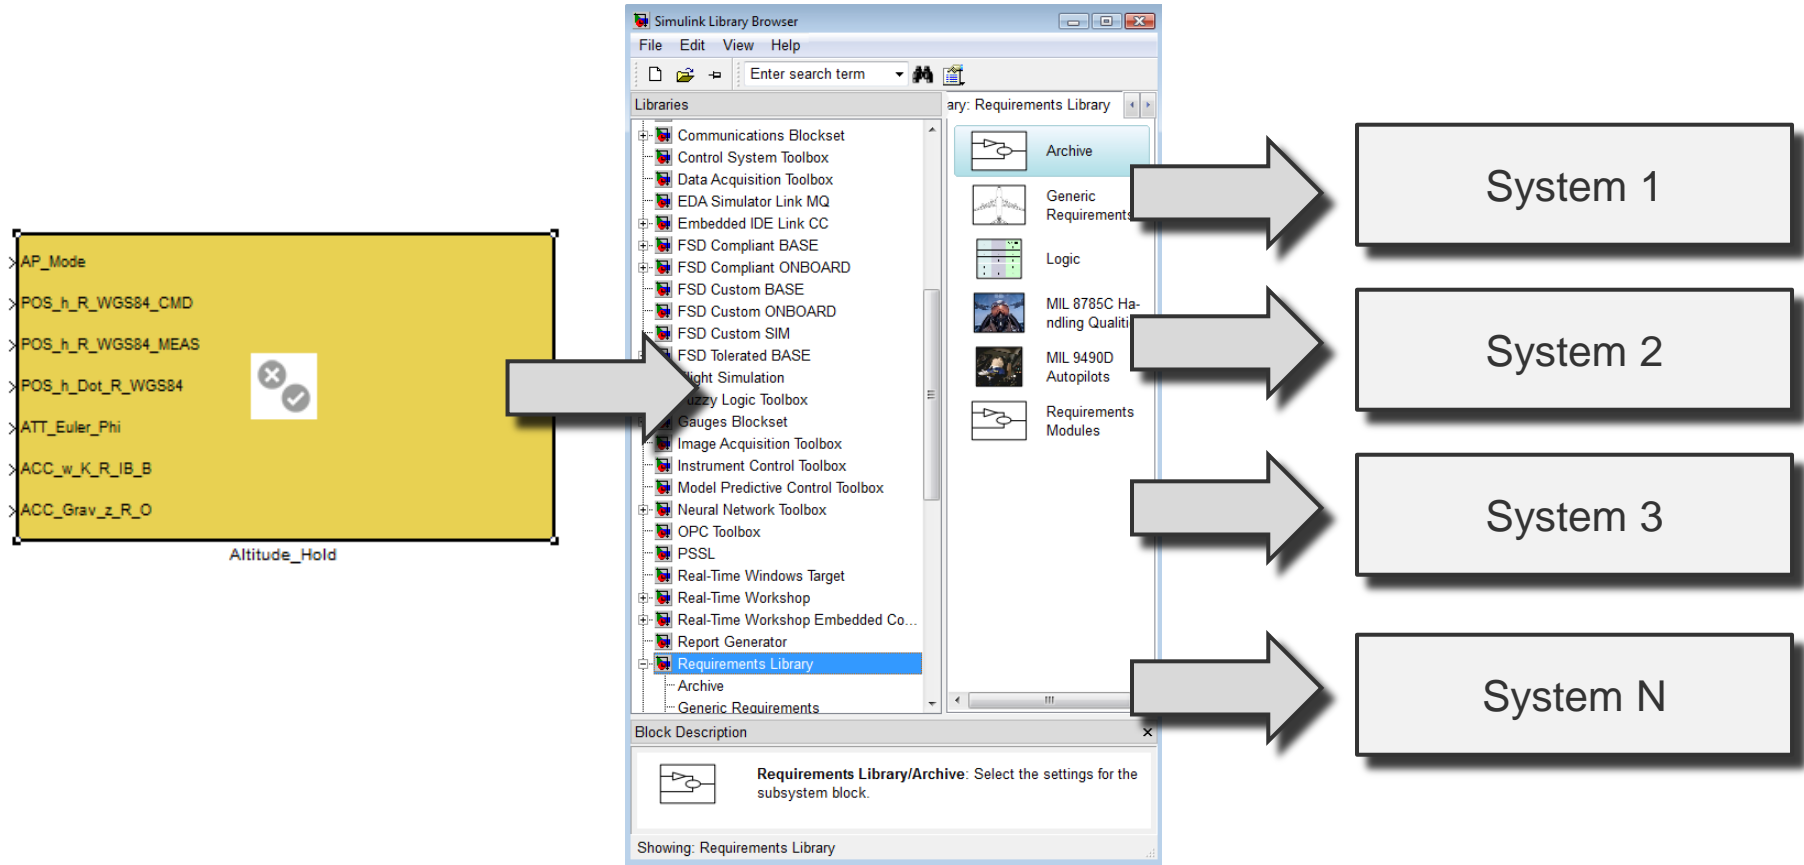

Variable	Reason for Monitoring
Vertical Speed	Main variable to be changed during the test
Δn_z	This variable needs to be within 0.2g to successfully pass the test

The 'Pass criteria' section is highlighted in red and contains the text: 'Pass criteria'.

Making Visions Fly

Collection of requirements in libraries for the purpose of reuse

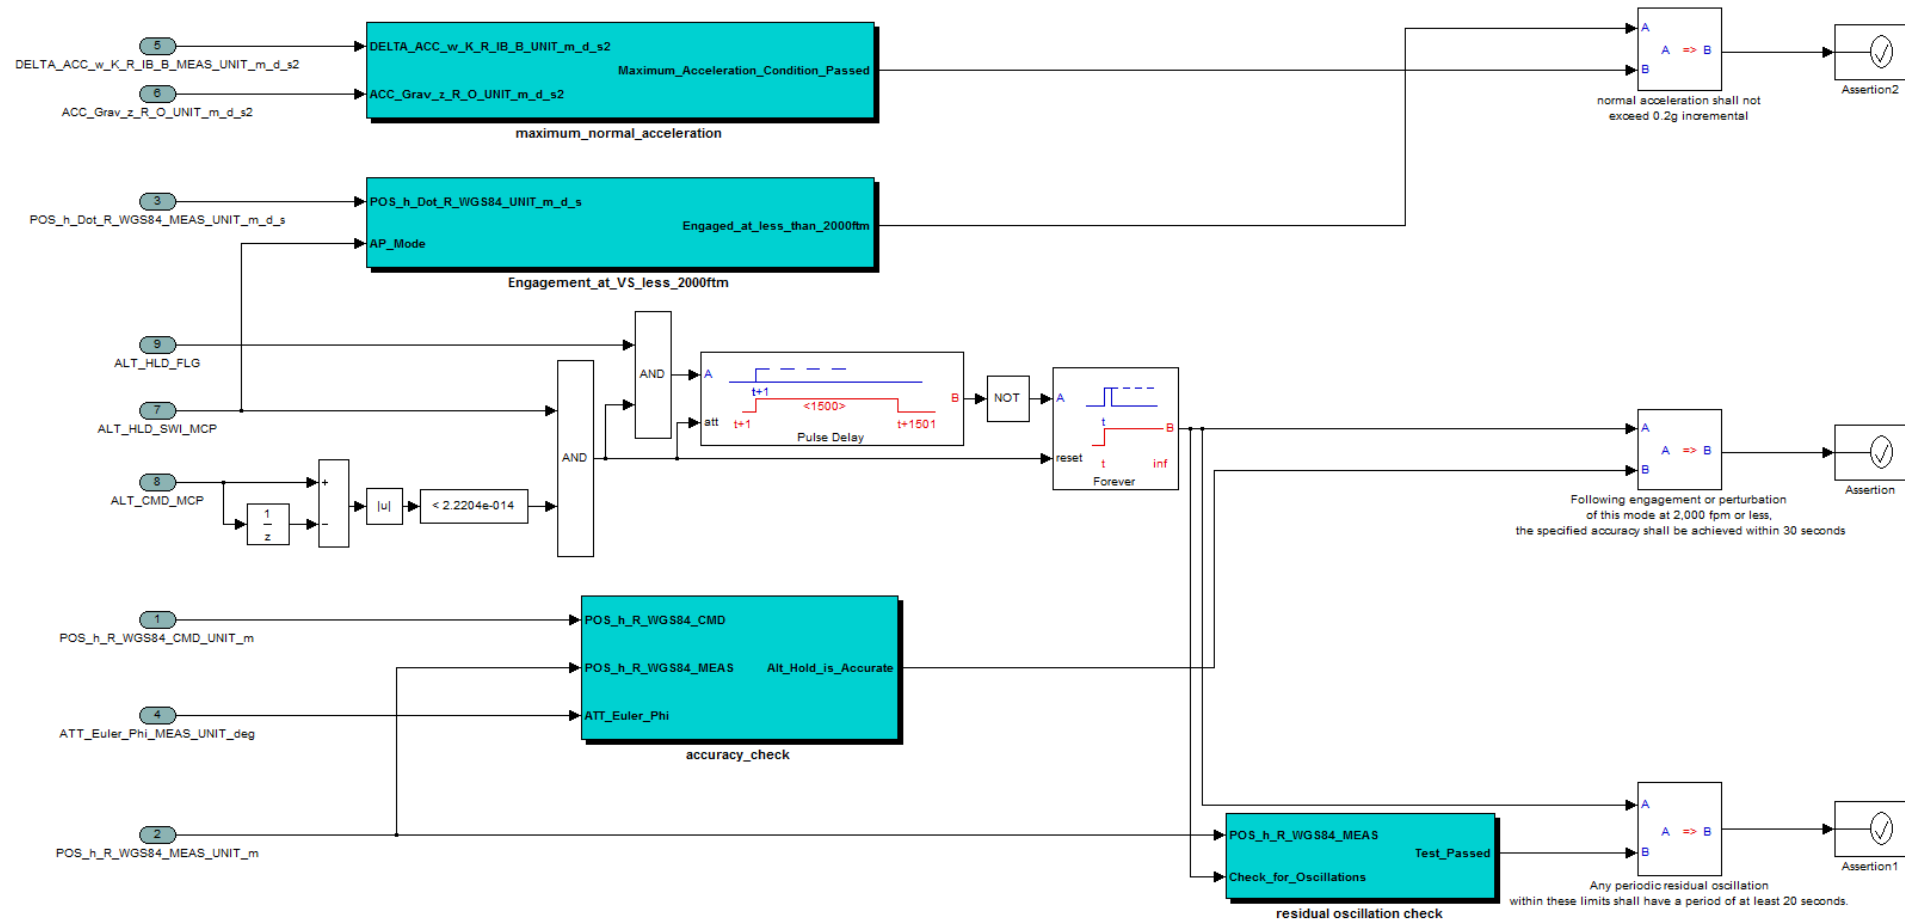

Recurring requirements (like requirements to autopilots) are collected in libraries for the purpose of reuse

⇒ Reduction of time and effort as well as better comparability of systems!

Making Visions Fly

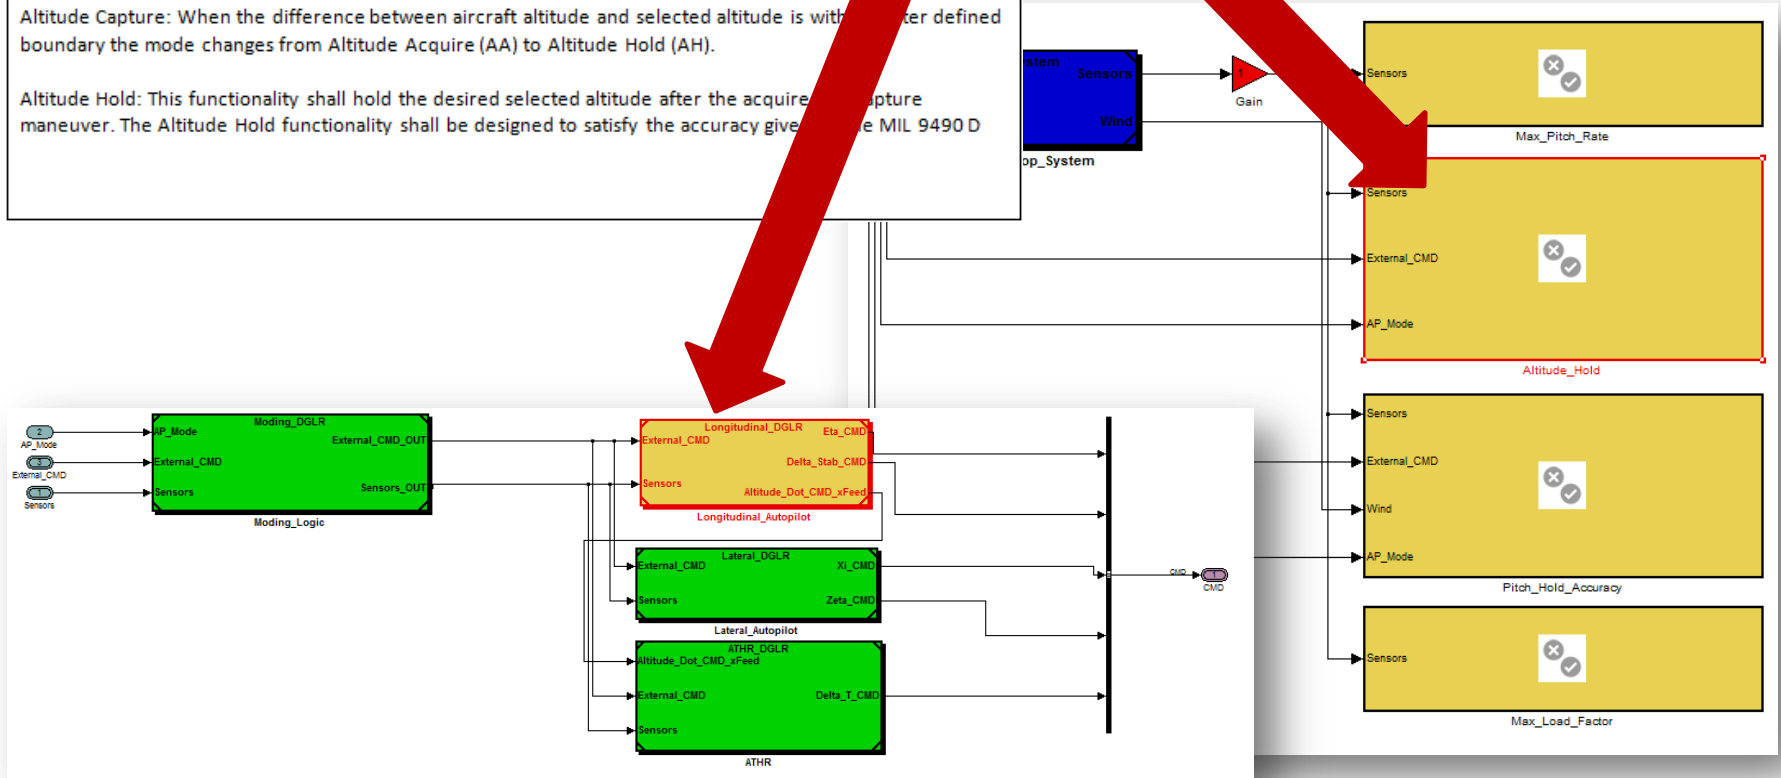

Complex Requirement

Making Visions Fly

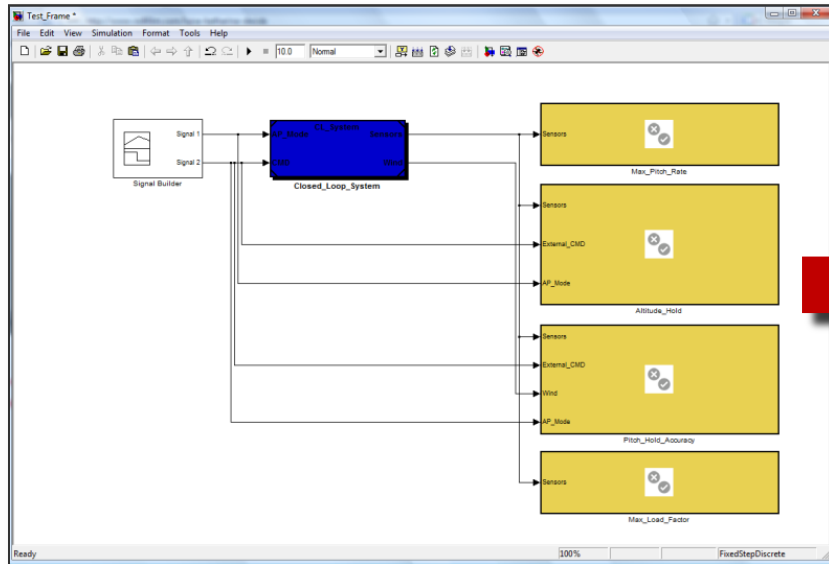

Traceability: Requirement to model / model to requirement

R-SC-WS09	Altitude Select & Hold
DGLR09-001	
<i>Derived From:</i>	Functional Description
Requirement Definition:	
An Altitude Select & Hold functionality shall be implemented. It shall consist of three modes:	
Altitude Acquire: The Altitude Acquire functionality takes the desired altitude and approaches the reference altitude by climbing with a constant rate.	
Altitude Capture: When the difference between aircraft altitude and selected altitude is within a user defined boundary the mode changes from Altitude Acquire (AA) to Altitude Hold (AH).	
Altitude Hold: This functionality shall hold the desired selected altitude after the acquire/capture maneuver. The Altitude Hold functionality shall be designed to satisfy the accuracy given in the MIL 9490 D

	Model Based Design of an Inner Loop Controller for a Small Unmanned Aerial Vehicle	Date: 2011-01-12
	Inner Loop Control Design	Rev: V-0001
		Page: 90 / 105

4.3.1.5 T-DA-FCS-03.1

Requirement Name:	Gain Phase Margin	4-13
Requirement ID	R-DA_FCS_03, R-DA_FCS_03.1	4-14
Description of Requirement Compliance Procedure		4-15

Compliance is shown by means of frequency response Bode and Nichols plots for the different control loops. The plots are generated at different velocities and altitudes along the operation flight envelope.

Vel	[15,20,25,30]
Alt	[0,3000]

The smallest gain and phase margin is presented.

Roll rate command loop:

Min. Gain Margin	14.9	[dB]
Min Phase Margin	-180	[deg]

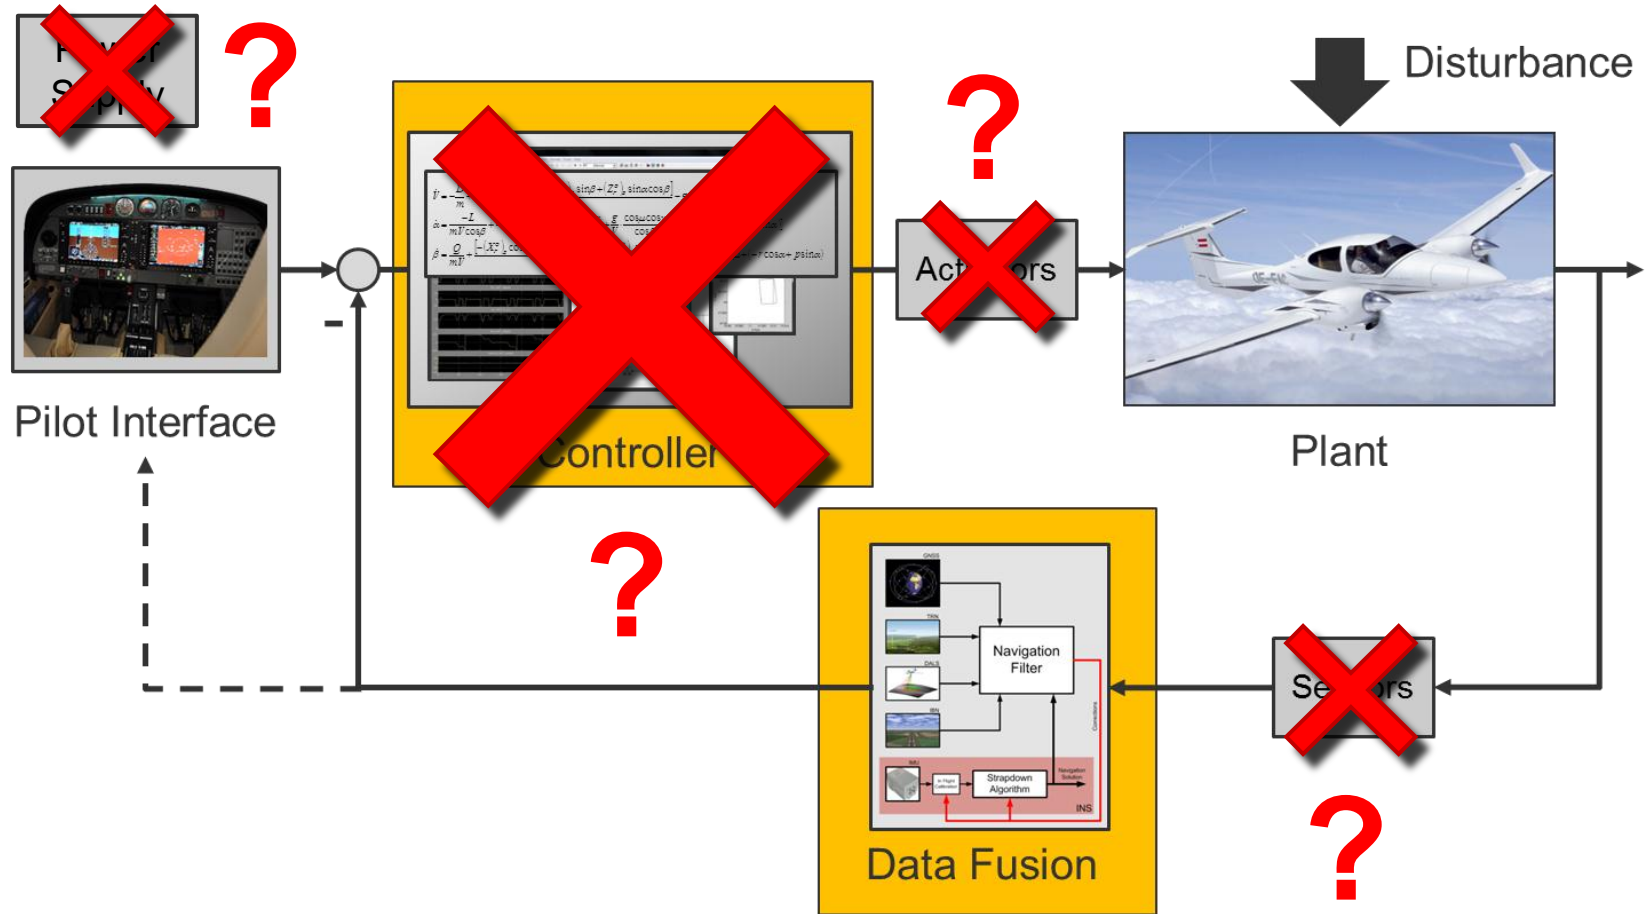

Figure 4.45: Bode Plot p_{cmd} to p

The Safety Assessment Process aims at answering the following questions:

- What could go wrong in the system?
- What are the consequences? How severe are they?
- How safe does the system need to be?
- Can the proposed system design be expected to be as safe as it should be?
- Is the actually implemented system design as safe as it should be?
- Are assumptions made during the system design analysis actually valid?
- **Can we trust our system to be as safe as we want it to be?**

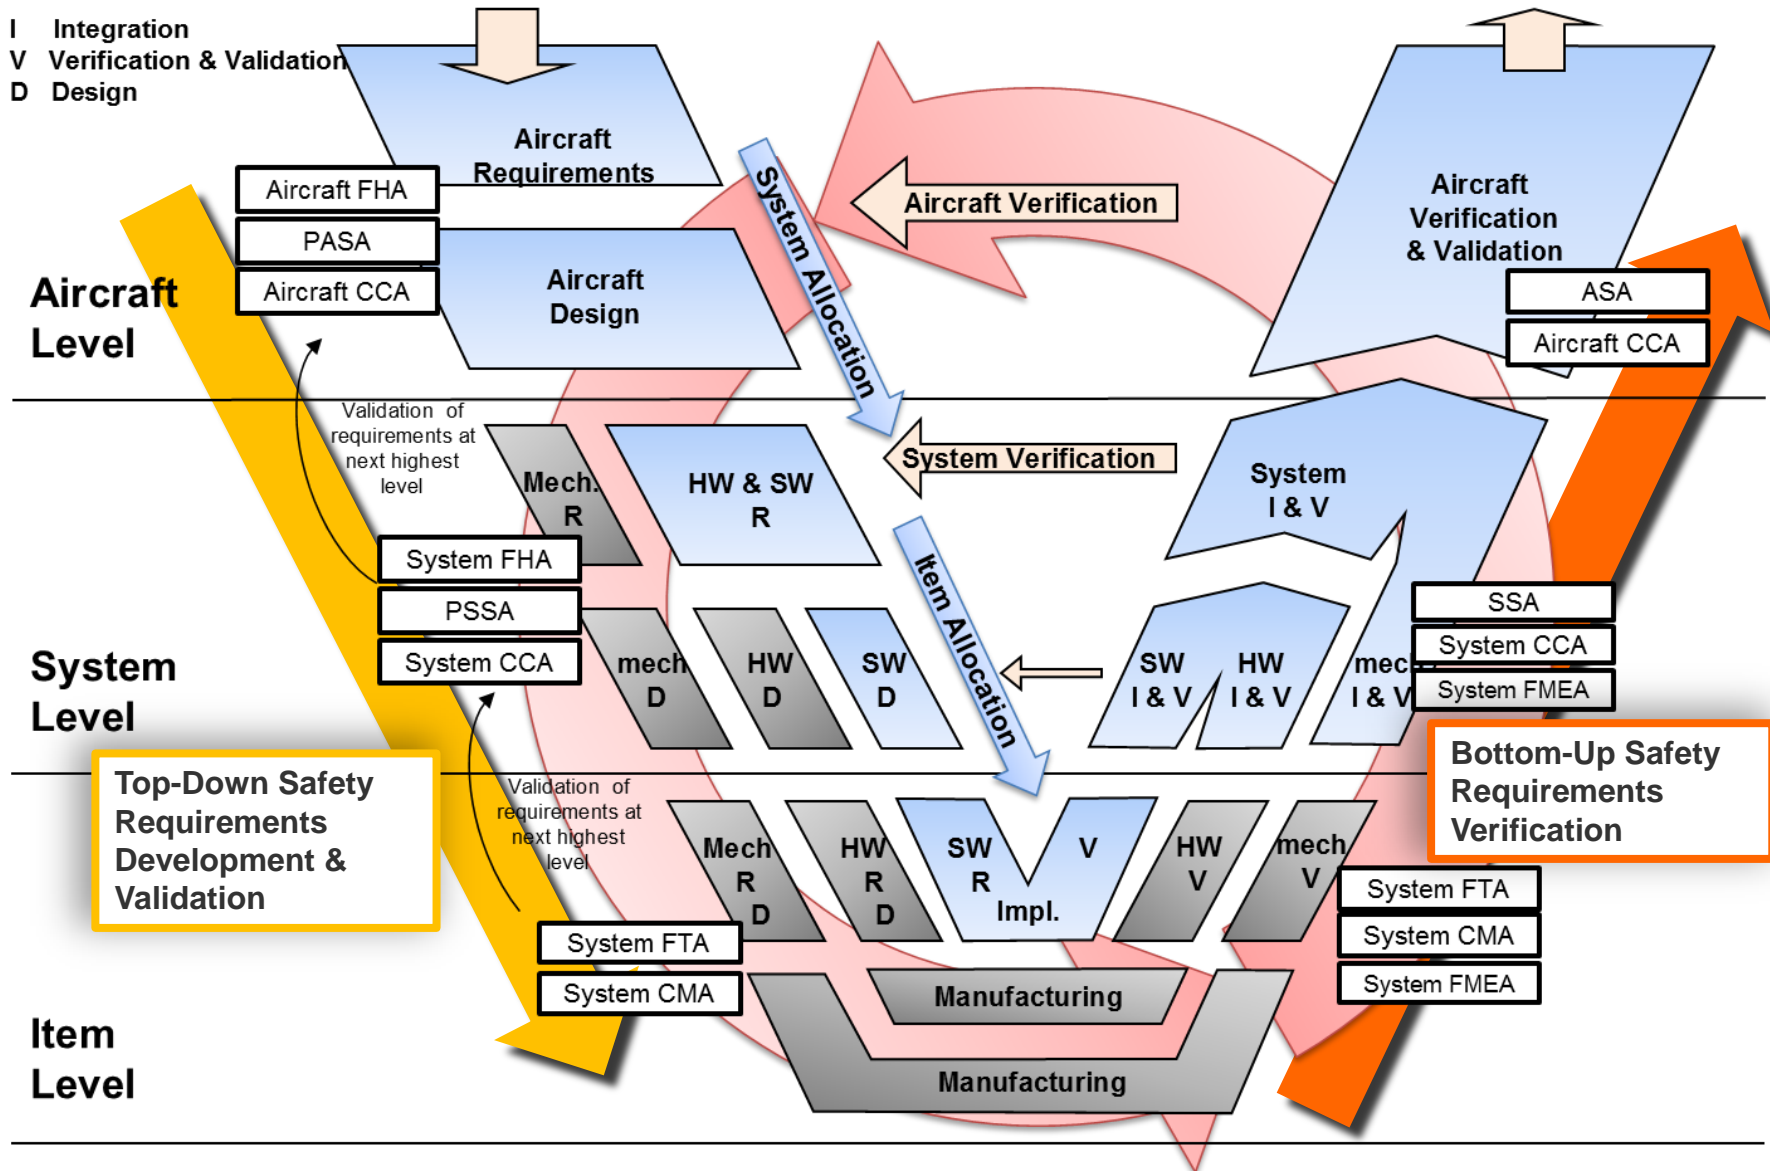

The Safety Assessment Process must be a combination of top-down and bottom-up activities for a holistic approach to system safety!

What happens if essential components fail?

Making Visions Fly

Interaction of Safety Assessment & Development Processes

Making Visions Fly

Excerpt CS-23 – Normal, Utility, Aerobatic & Commuter Aircraft

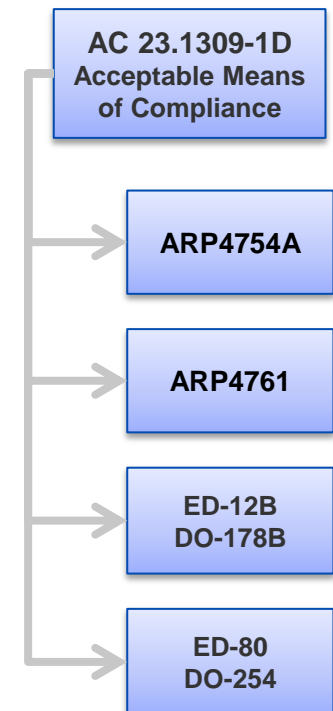

CS-23.1309 Equipment, systems and installations

(b) The design of each item of equipment, each system, and each installation must be examined separately and in relationship to other aeroplane systems and installations to determine if the aeroplane is dependent upon its function for continued safe flight and landing ...

Each item of equipment, each system, and each installation identified by this examination as one upon which the aeroplane is dependent for proper functioning to ensure continued safe flight and landing, or whose failure would significantly reduce the capability of the aeroplane or the ability of the crew to cope with adverse operating conditions, must be designed to comply with the following additional requirements:

- (1) It must perform its intended function under any foreseeable operating condition.
- (2) When systems and associated components are considered separately and in relation to other systems –
 - (i) The occurrence of any failure condition that would prevent the continued safe flight and landing of the aeroplane must be **extremely improbable**
 - (ii) The occurrence of any other failure condition that would significantly reduce the capability of the aeroplane or the ability of the crew to cope with adverse operating conditions must be **improbable**.

How probable is improbable / extremely improbable?

Making Visions Fly

Acceptable Means of Compliance

EASA CS-23 Book 2 - Acceptable Means of Compliance:

- What AMC's are available for Flight Control Systems?
- Book 2 of the CS-23 does not provide any acceptable means of showing compliance relevant for Digital Flight Control Systems.
- EASA Certification Review Item GA/G/001 refers to AC (Advisory Circular) 23.1309-1D from the FAA for showing compliance with §23.1309

Development Guidelines:

- **SAE ARP4754 Revision A** (issued Dec 2010):
“Guidelines for Development of Civil Aircraft and Systems”
- **SAE ARP4761** (issued December 1996)
“Guidelines and Methods for Conducting the Safety Assessment Process on Civil Airborne Systems and Equipment”
- **RTCA DO-178B** (issued December 1992)
“Software Considerations in Airborne Systems and Equipment Certification”
- **RTCA DO-254** (issued April 2000)
“Design Assurance Guidance for Airborne Electronic Hardware”

These standards outline methods – but not the only methods – of showing compliance with the Advisory Circular AC 23.1309 and therefore to the § 23.1309.

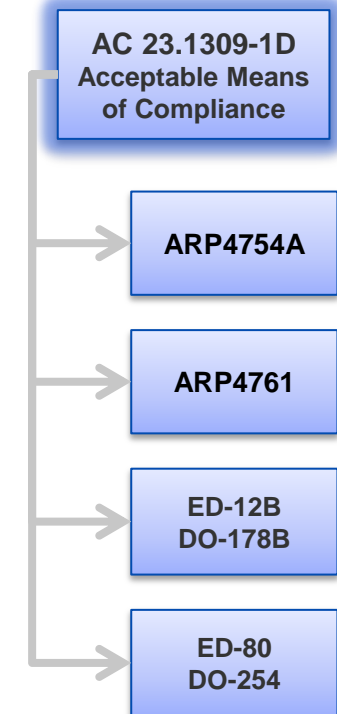

Making Visions Fly

Acceptable Means of Compliance

Classification of Failure Conditions	No Safety Effect	<---Minor--->	<---Major--->	<---Hazardous--->	<Catastrophic>
Allowable Qualitative Probability	No Probability Requirement	Probable	Remote	Extremely Remote	Extremely Improbable
Effect on Airplane	No effect on operational capabilities or safety	Slight reduction in functional capabilities or safety margins	Significant reduction in functional capabilities or safety margins	Large reduction in functional capabilities or safety margins	Normally with hull loss
Effect on Occupants	Inconvenience for passengers	Physical discomfort for passengers	Physical distress to passengers, possibly including injuries	Serious or fatal injury to an occupant	Multiple fatalities
Effect on Flight Crew	No effect on flight crew	Slight increase in workload or use of emergency procedures	Physical discomfort or a significant increase in workload	Physical distress or excessive workload impairs ability to perform tasks	Fatal Injury or incapacitation
Classes of Airplanes:	Allowable Quantitative Probabilities and Software (SW) and Complex Hardware (HW) DALs (Note 2)				
Class I (Typically SRE under 6,000 lbs.)	No Probability or SW & HW DALs Requirement	<10 ⁻³ Note 1 & 4 P=D, S=D	<10 ⁻⁴ Notes 1 & 4 P=C, S=D P=D, S=D(Note 5)	<10 ⁻⁵ Notes 4 P=C, S=D P=D, S=D(Note 5)	<10 ⁻⁶ Note 3 P=C, S=C
Class II (Typically MRE, STE, or MTE under 6000 lbs.)	No Probability or SW & HW DALs Requirement	<10 ⁻³ Note 1 & 4 P=D, S=D	<10 ⁻⁵ Notes 1 & 4 P=C, S=D P=D, S=D(Note 5)	<10 ⁻⁶ Notes 4 P=C, S=C P=D, S=D(Note 5)	<10 ⁻⁷ Note 3 P=C, S=C
Class III (Typically SRE, STE, MRE, & MTE equal or over 6000 lbs.)	No Probability or SW & HW DALs Requirement	<10 ⁻³ Note 1 & 4 P=D, S=D	<10 ⁻⁵ Notes 1 & 4 P=C, S=D	<10 ⁻⁷ Notes 4 P=C, S=C	<10 ⁻⁸ Note 3 P=B, S=C
Class IV (Typically Commuter Category)	No Probability or SW & HW DALs Requirement	<10 ⁻³ Note 1 & 4 P=D, S=D	<10 ⁻⁵ Notes 1 & 4 P=C, S=D	<10 ⁻⁷ Notes 4 P=B, S=C	<10 ⁻⁹ Note 3 P=A, S=B
Note 1: Numerical values indicate an order of probability range and are provided here as a reference. The applicant is usually not required to perform a quantitative analysis for minor and major failure conditions. See figure 3. Note 2: The alphabets denote the typical SW and HW DALs for most primary system (P) and secondary system (S). For example, HW or SW DALs Level A on primary system is noted by P=A. See paragraphs 13 & 21 for more guidance. Note 3: At airplane function level, no single failure will result in a catastrophic failure condition. Note 4: Secondary system (S) may not be required to meet probability goals. If installed, S should meet stated criteria. Note 5: A reduction of DALs applies only for navigation, communication, and surveillance systems if an altitude encoding altimeter transponder is installed and it provides the appropriate mitigations. See paragraphs 13 & 21 for more information.					

Classification of Failure Conditions and Probability:

- Minor <math>< 10^{-3}</math>
- Major <math>< 10^{-5}</math>
- Hazardous <math>< 10^{-7}</math>
- Catastrophic <math>< 10^{-9}</math>

“FIGURE 2. RELATIONSHIP AMONG AIRPLANE CLASSES, PROBABILITIES, SEVERITY OF FAILURE CONDITIONS, AND SOFTWARE AND COMPLEX HARDWARE DALs”

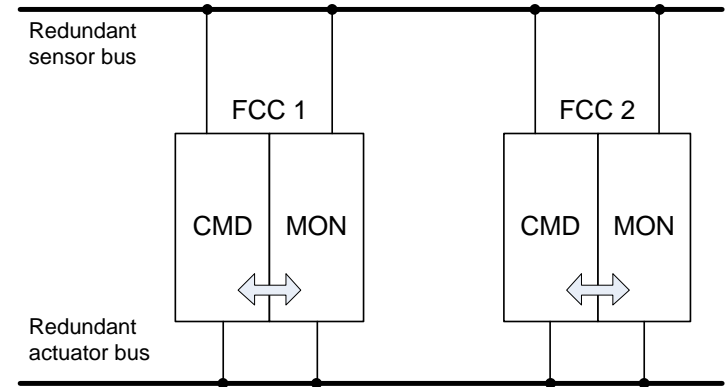

Making Visions Fly

Fault Tree Analysis

Example

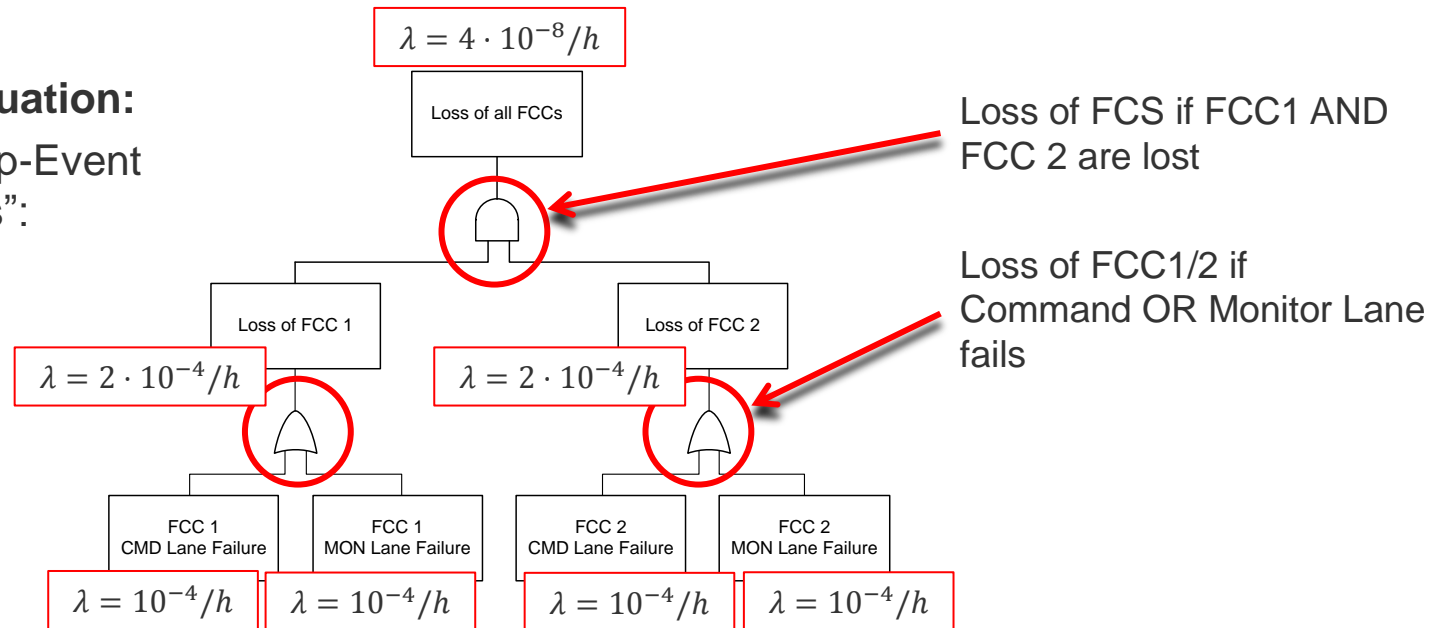

Fail-Op Dual-Duplex FCS

- Two FCCs, each with one command and one monitor lane.
- If command or monitor lane fail, entire FCC is passivated.
- FCS failure if both FCCs fail

Qualitative Evaluation:

Fault Tree for Top-Event
“Loss of all FCCs”:

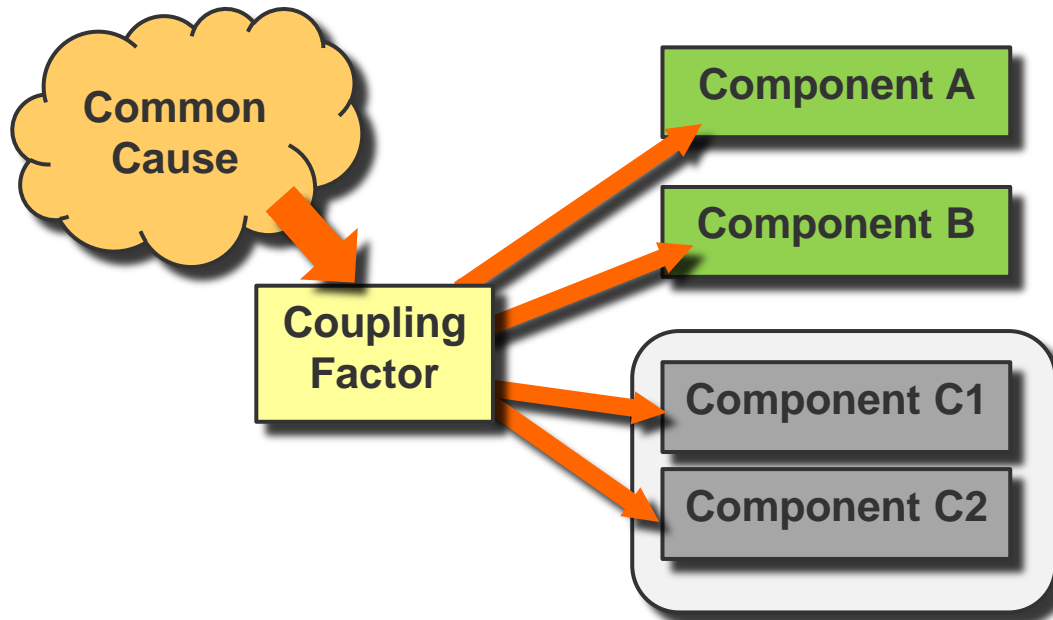

⇒ Formulation of derived requirements considering safety aspects.

Making Visions Fly

Common Cause Analysis

- A common cause analysis (CCA) examines the proposed aircraft or system architecture(s) to ensure that independence between functions, systems or items required to satisfy safety or regulatory requirements exists.
- The CCA identifies individual failure modes or external events that can lead to catastrophic or hazardous failure conditions. It consists of the following analyses.

Particular Risk Analysis (PRA):

Particular Risks are events or incidents affecting the system from the outside:

- EMI / HIRF,
- Hail, Ice, Snow
- Bird strikes
- Fire, Smoke,
- Engine rotor burst, tyre burst, ...

Common Mode Analysis (CMA):

A CMA is a simultaneous failure of multiple components otherwise considered redundant, e.g. due to:

- Software error (OS, libraries, compiler)
- Hardware (processor, layout, ...)
- Power supply

Zonal Safety Analysis (ZSA):

Ensure that installation meet safety requirements regarding interference between systems, potential cascade failures, environmental factors, maintenance errors etc.

Making Visions Fly

Consideration of System and Component Specific Behavior

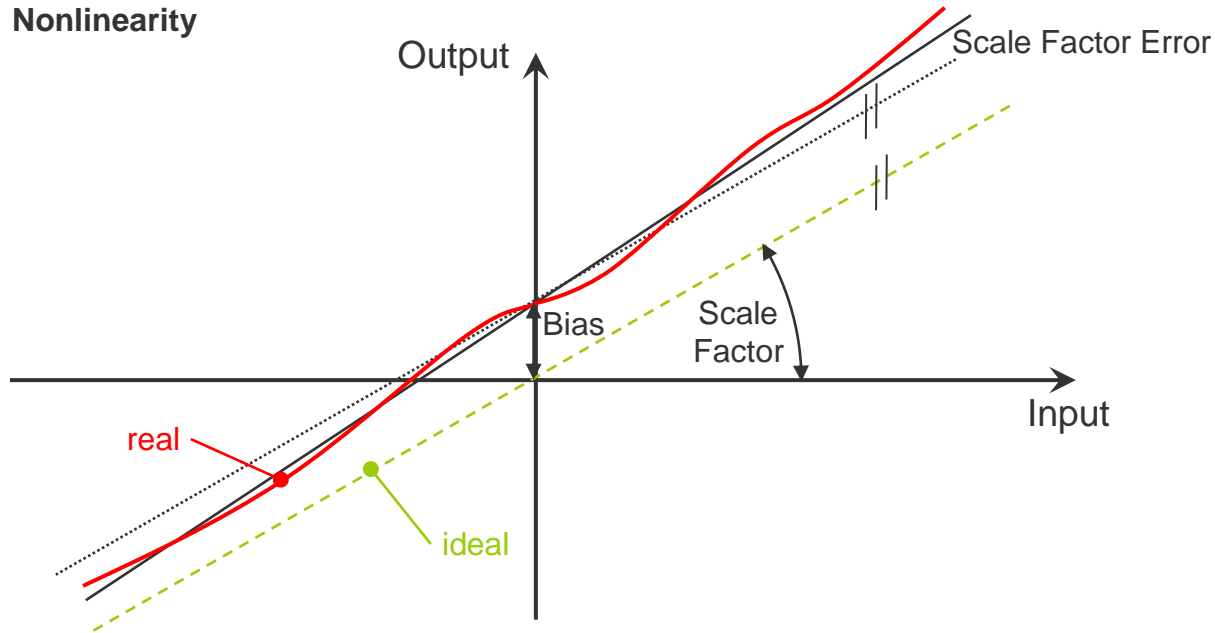

- Consideration of the characteristics of involved systems and subsystems
 - ⇒ Sensors
 - ⇒ Actuators
 - ⇒ computers
 - ⇒ communication channels
- Analysis of available sensors and measurement data
- Data fusion principles
- Component specific tradeoffs concerning:
 - ⇒ Availability
 - ⇒ Price
 - ⇒ Accuracy and precision
 - ⇒ Integration effort
 - ⇒ Reliability
 - ⇒ Error behaviour
- Redundancy Concepts

Making Visions Fly

Sensor Errors (1)

Sensor measurements are normally faulty. The output signal differs from the input acceleration to be measured.

► Bias, Scale Factor Error, Nonlinearity

► Asymmetry

► Hysteresis

- **Bias:** Non-zero output value even though there is no input
- **Scale Factor Error:** Deviation of the output / input ratio from the ideal scale factor
- **Nonlinearity:** Non-linear scale factor
- **Asymmetry:** Different scale factors for positive and negative inputs
- **Hysteresis:** Different outputs for increasing and decreasing inputs

Making Visions Fly

Sensor Errors (2)

➡ Bias Instability

➡ Dead Band

➡ Resolution

➡ Turn-On Bias

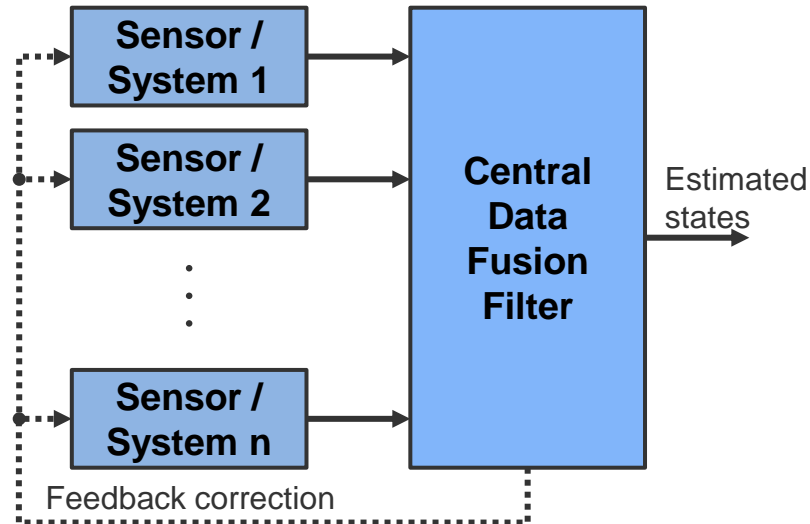

- *Bias Instability*: Random medium to long-term bias variation
- *Dead Band, Threshold*: Small area around null where inputs are not detected e.g. due to stiction
- *Resolution/Quantization*: Minimum measurable input/floating point representation
- *Turn-On Bias*: Variation of scale factor and bias from day-to-day
- *Misalignment*: Non-orthogonality of sensor axes
- *Noise*: Random short-term variation
- *Temperature Effect*: Sensor errors caused by temperature variation

NAV Sensor Concepts for ATOL

COTS ADAHRS with internal GPS

Advantages

- Low integration effort

Disadvantages

- No integrity information on GPS(VPL, HPL)
- No GBAS functionality available

COTS ADAHRS and external GPS (SBAS / GBAS)

Advantages

- Medium integration effort

Disadvantages

- Inconsistent navigation solution (GPS vs. IMU)
Sensor Data Fusion required

COTS ADAHRS aided by external GPS (SBAS / GBAS)

Advantages

- Medium integration effort
- Consistent navigation solution

Disadvantages

- No integrity information of resulting navigation solution from GPS aided AHRS

Additional things to be considered

- High precision altitude sensor integration and data fusion for consistency and integrity of vertical navigation channel during approach
- Integrity monitoring of VPL, HPL and other integrity information
- Provision of integrity Information to GCS
- Degree of redundancy in navigation solution

Making Visions Fly

Simulation of the overall system

- The more complex the simulation model gets, the more detailed the reality will be represented.
 - ⇒ **Objective: simulation of the overall system!**
- Attempt to model as many uncertainties, characteristics and external influences as possible
- Anticipation of problems and obstacles in the simulation

Making Visions Fly

Foreseeable obstacles to be adressed already in simulations

Plant uncertainties

- Parametric uncertainties (aerodynamic coefficients, weight and balance, ...)
- Simplifications and unmodelled dynamics (dynamic order of subsystems, aeroelastics, ...)
- Unknown dynamics (nonlinear structure of aerodynamics, interferences, ...)

Atmospheric disturbances

- Turbulence, Gusts
- Wind

Hardware characteristics

- Sensor measurements (noise, bias, outliers, delays ...)
- Digitalization effects (quantization, data types, delays,...)
- Flight control computer (processor load, interrupt and I/O-handling,...)
- Equivalence between simulated control laws and compiled and linked code on target

Making Visions Fly

Foreseeable obstacles to be adressed already in simulations

Correctness of implementation and coverage over operational envelope

- Implementation flaws(Initialization, Anti-Integrator wind up and reset, interfaces, ...)
- Verification Coverage (consideration of all operational conditions)

=> Closed loop simulations can address these obstacles...

- Model-in-the-Loop
- Software-in-the-Loop
- Hardware-in-the-Loop
- Processor-in-the-Loop

=> ... Many of them even without a validated model

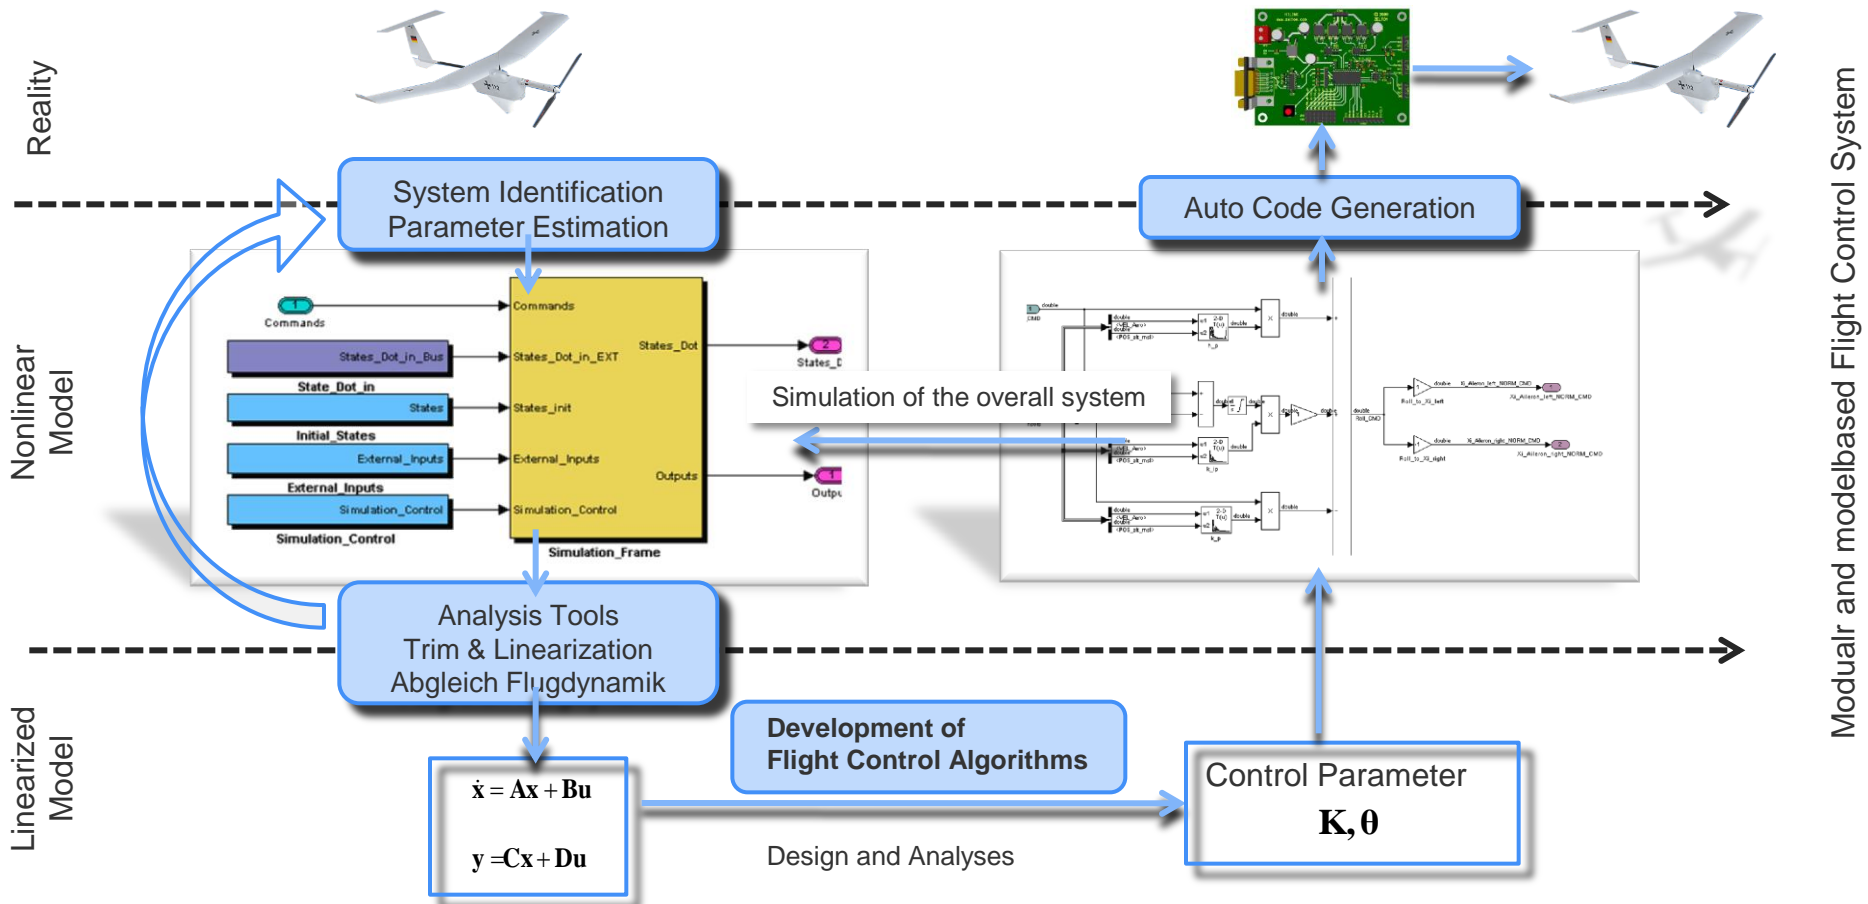

Making Visions Fly

Modelbased Development Process

Adaption of the simulation model to reality with the help of parameter estimation and system identification as an iterative process!

Making Visions Fly

Modelbased Development Process

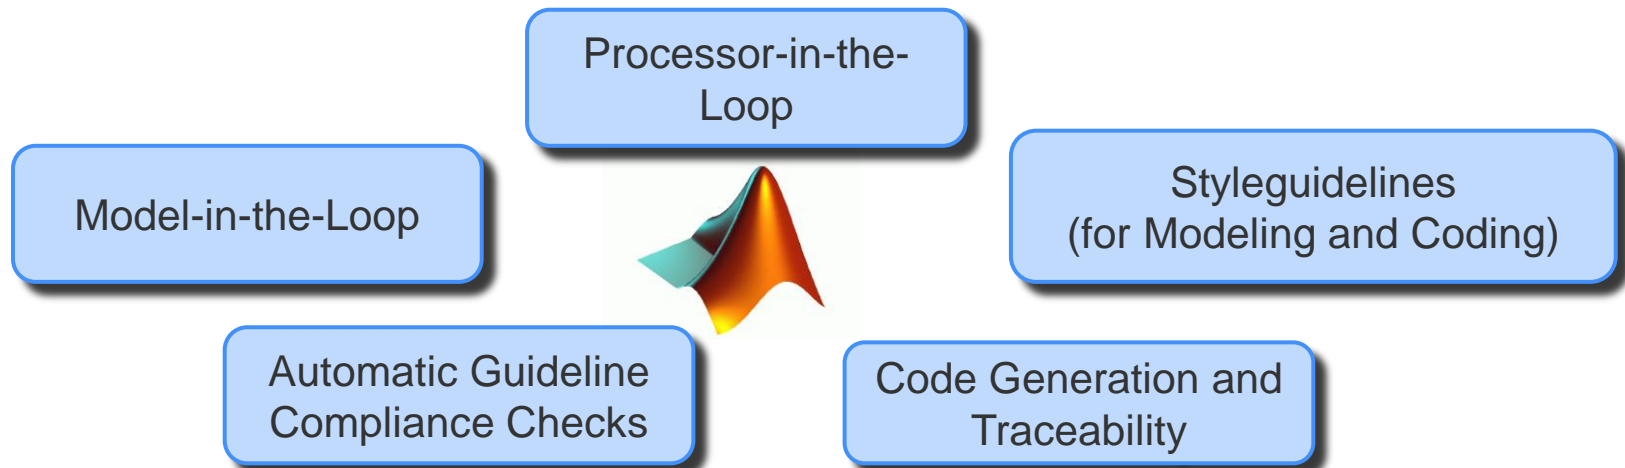

- Performance can be increased by the use of high-level development systems at simultaneous control of functional complexity
- The development process can be almost entirely computer based
- Deterministic and reproducible development

Making Visions Fly

Aspects of Implementation

Aspects of implementation:

- Proceedings during implementation
- Styleguidelines
- Model-in-the-Loop simulation
- Code generation and requirement tracing
- Processor-in-the-Loop simulation
- Hardware-in-the-Loop simulation
- Iron-Bird testing

Making Visions Fly

Guideline compliance with model advisor

Verification of guideline compliance with model advisor and custom FSD rules

Objectives:

- DO 178B compliance, FSD styleguidelines compliance
- Automatic generation of compliance reports

Making Visions Fly

Conclusion of Model-in-the-Loop Verification

- Complete system functionality can be built up and verified, e.g. up to mission flight

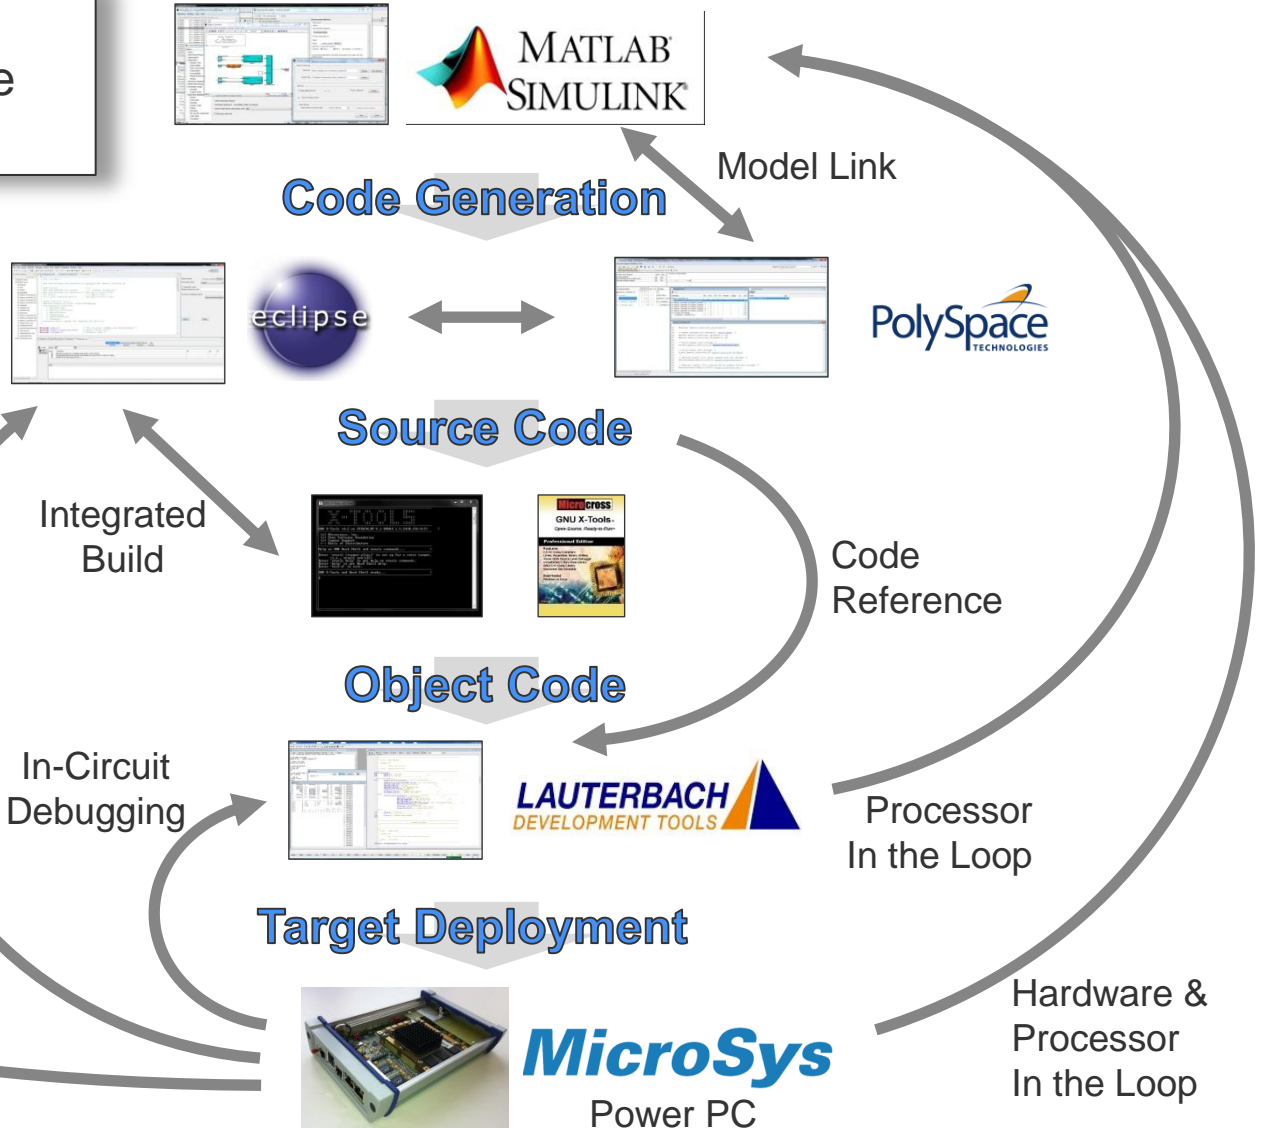

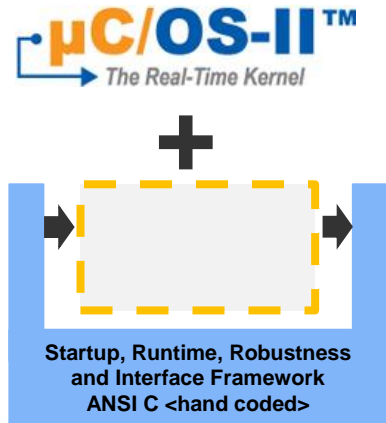

- Closed-loop simulation is a key advantage for modelbased verification
- Code generation and target deployment is effectively eased

Making Visions Fly

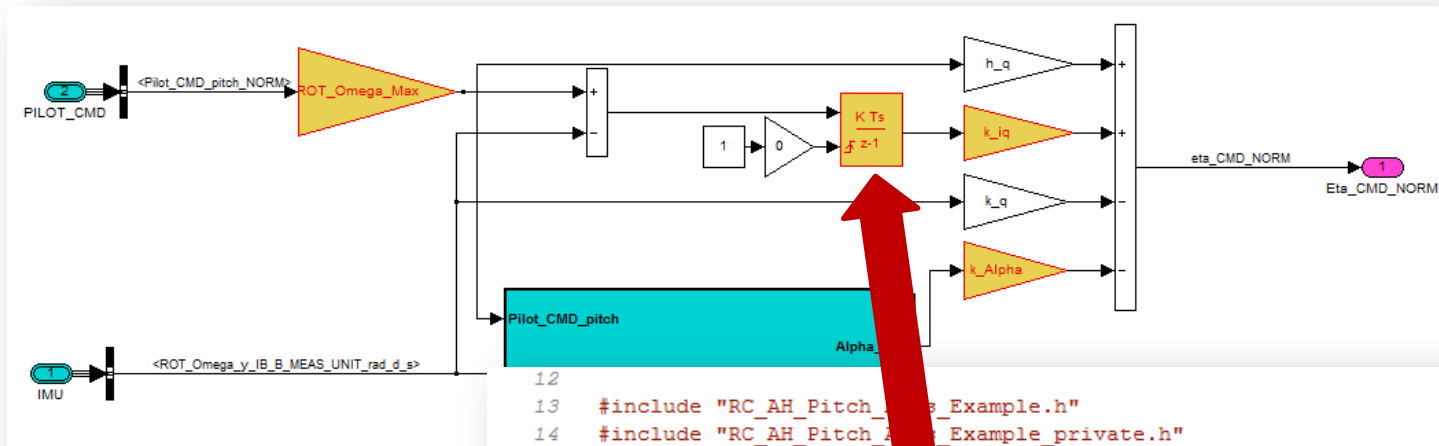

Tool Chain Structure and Workflow for Power PC

- Final Tool Chain
- Fully in use in Aerospace Industry up to DAL A

Making Visions Fly

Code generation and requirement tracing

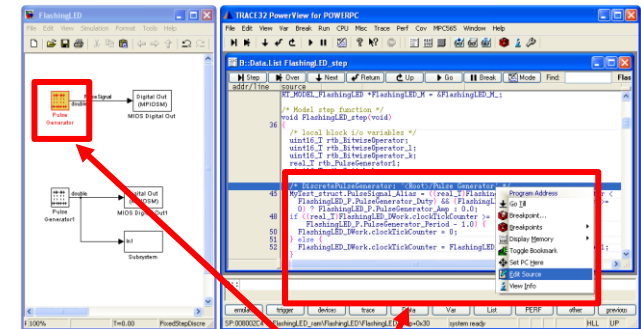

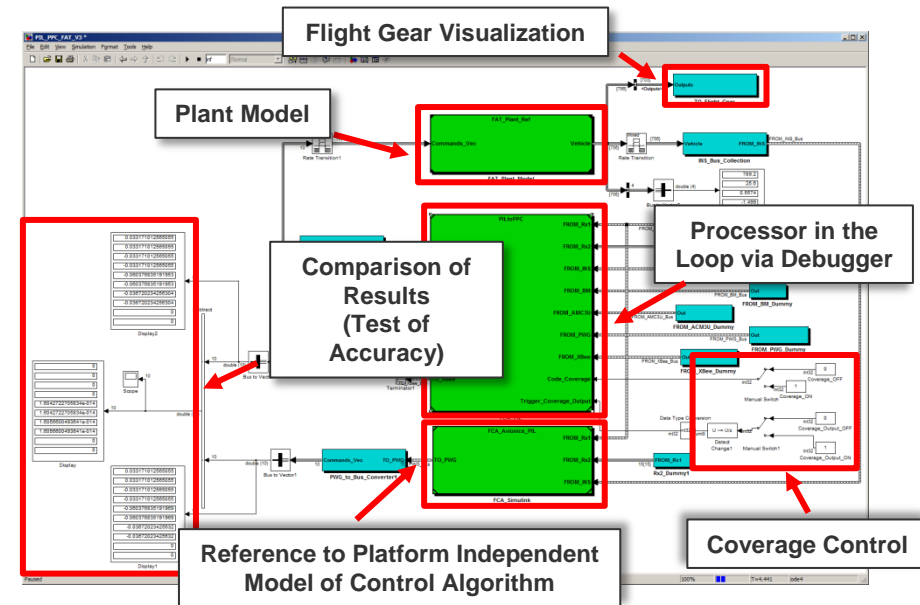

```

Making Visions Fly

Processor in the Loop (PIL) Test Bench

General Description

- New approach for PIL:
 - ✓ No instrumentation of target software
 - ✓ Final software product including all frameworks, drivers and operating system
 - ✓ Communication via JTAG
 - ✓ Compatible to auto generated code and handwritten code
- Focus on numerical accuracy on target processor (e.g. differences in libraries and floating point operations)
- Fully integrated in Simulink and TRACE32 Debugger
- Seamless debugging of generated code on real target (e.g. executable links between model and object code, definition of break points through Simulink block menu)
- Structural code coverage analysis on object code using either VerOCode or TRACE32

Additional information:

http://www.lauterbach.com/simulink_2012.pdf

Traceability between
Simulink and Trace32

Making Visions Fly

Hardware in the Loop (HIL) Test Bench

General Description

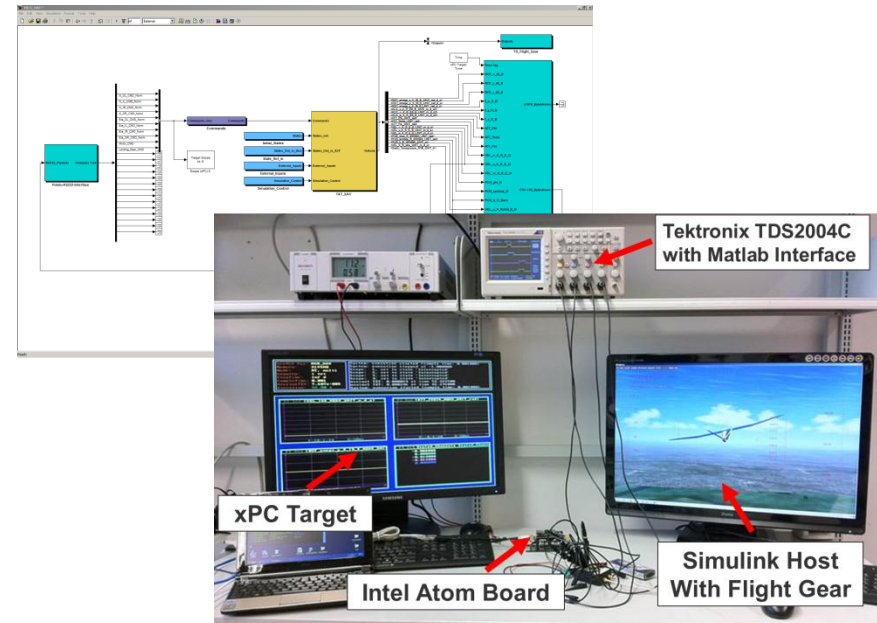

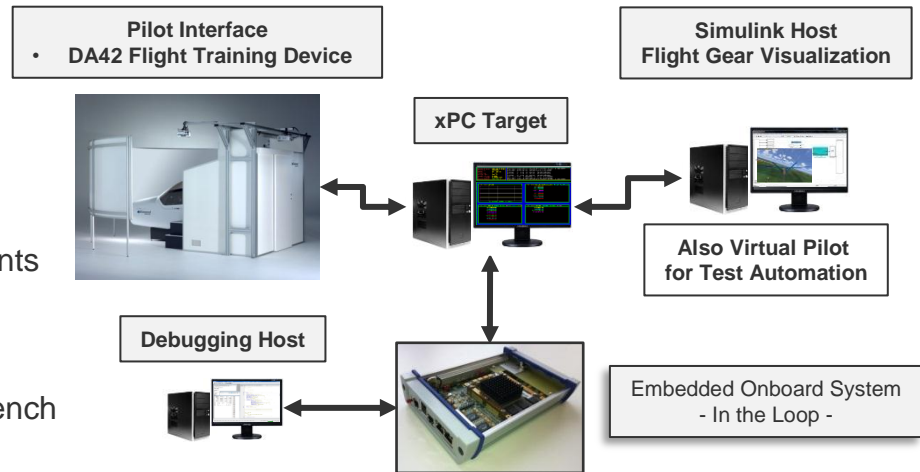

- Test bench for integration testing of fly by wire system.
- Focus on performance, robustness and interface testing
- Reuse of controller development plant model and requirements based test cases.
- Integration of HIL testing and flight simulation through direct interface between DA42 flight training device and HIL test bench

MathWorks xPC Target Simulation Desktop

- Real time operating system running on standard desktop computer
- Fully integrated within Matlab/Simulink
- Multiple I/Os through National Instrument PXI System (supported by xPC Target)

Additional Equipment

- Tektronix TDS2004C Oscilloscope
- Vector CANoe for ARINC825 simulation and testing
- Multiple Lauterbach Debuggers, 500MHz logic analyzer and stimuli generator
- B&R PLCs for simulation of bus devices

Making Visions Fly

In-Flight-Testing

Diamond DA-42 Flight Training Device

General Description

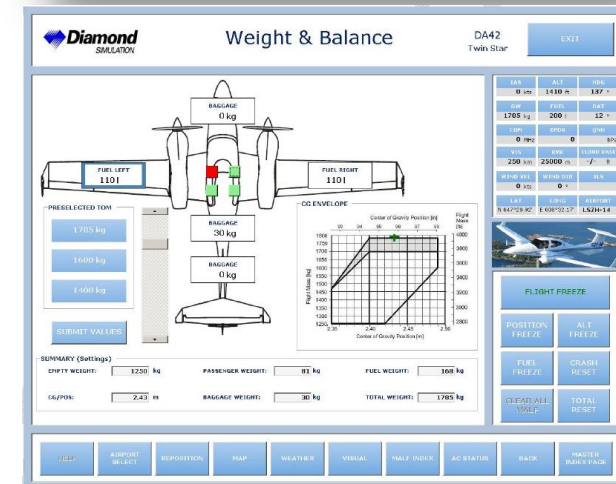

- Built with original aircraft components from Diamond Aircraft to achieve a most realistic cockpit environment
- Certifiable up to FTD Level 5+, Level 6 dynamics under development
- Accurate replication of aircraft flight dynamics and systems
- Original Garmin G1000 PFD and MFD hardware
- Electrically operated three-axes control loading system
- Multi-screen instructor operating station (IOS) aft of cabin
- Extensive capability to simulate malfunctions of multiple aircraft systems

Flight Dynamic Model (FDM)

- FDM includes accurate aerodynamics, engine, propeller and gear models
- Based on reference data from airframe manufacturer Diamond Aircraft and parameter estimation performed by Diamond Simulation

External Visual System (EVS)

- Three-channel external visual system (EVS) with 180-degree cylindrical screen
- Visual software: CAE Tropos 1000, based on full-flight EVS Tropos 6000
- Projection system and the visual databases meet certification requirements up to Level B Full Flight Simulators according to the regulations of the JAA and FAA

Making Visions Fly

Iron-Bird-Testing

- Testing and analysis of flight control systems
- Test of hardware components embedded in the real system environment
 - ⇒ Actuators
 - ⇒ Clutches
 - ⇒ Intervention to flight controls
- Test of handling qualities
- Test of safety mechanisms
- Test of faults and automatic fault recovery
- Hardware-in-the-Loop-Testing / Interface to D-Sim42 NG Simulator

Thank you very much for your attention!
