KATHOLIEKE UNIVERSITEIT LEUVEN

Data mining in molecular karyotyping: linked analysis of Array-CGH data and biomedical text

Public PhD defense
September 28th, 2009

Steven Van Vooren

Department of Electrical Engineering
Katholieke Universiteit Leuven

Examination board:

prof. dr. ir. E. Aernoudt (chairman)
prof. dr. ir. B. De Moor (promotor)
prof. dr. ir. Y. Moreau (promotor)
prof. dr. ir. J. Vermeesch
prof. dr. ir. M. Bruynooghe
prof. dr. ir. S. Vanhuffel
prof. dr. K. Devriendt
prof. dr. F. Speleman (UGent)
Dr. D. Rebholz-Schuhmann (EBI)

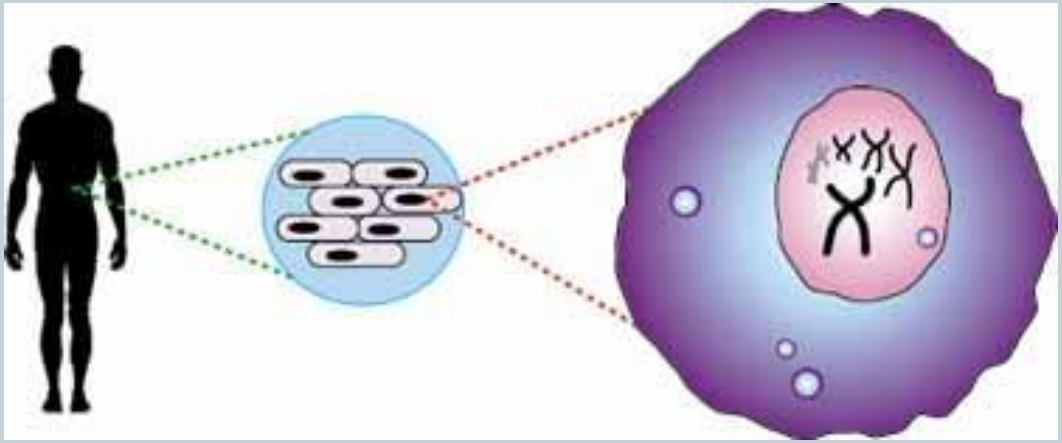
Overview of presentation

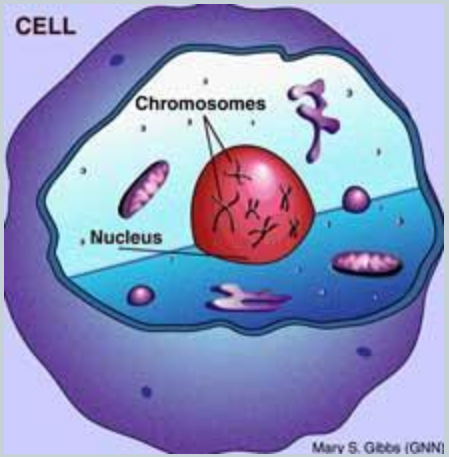
- **Introduction** – Genome variation
- **Chapter 1** – Introduction and context
- **Chapter 2** – ArrayCGH data management and analysis
- **Chapter 3** – Functional interpretation of genetic information
- **Chapter 4** – Intelligent databases for constitutional cytogenetics
- **Chapter 5** – Genome annotation
- **Chapter 6** – Data fusion on biomedical text & gene expression arrays
- **Chapter 7** – Conclusions and perspectives

Introduction to Genome Variation

AN OVERVIEW

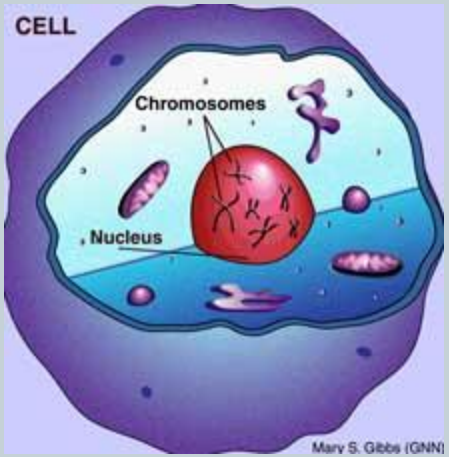
People – tissues – cells



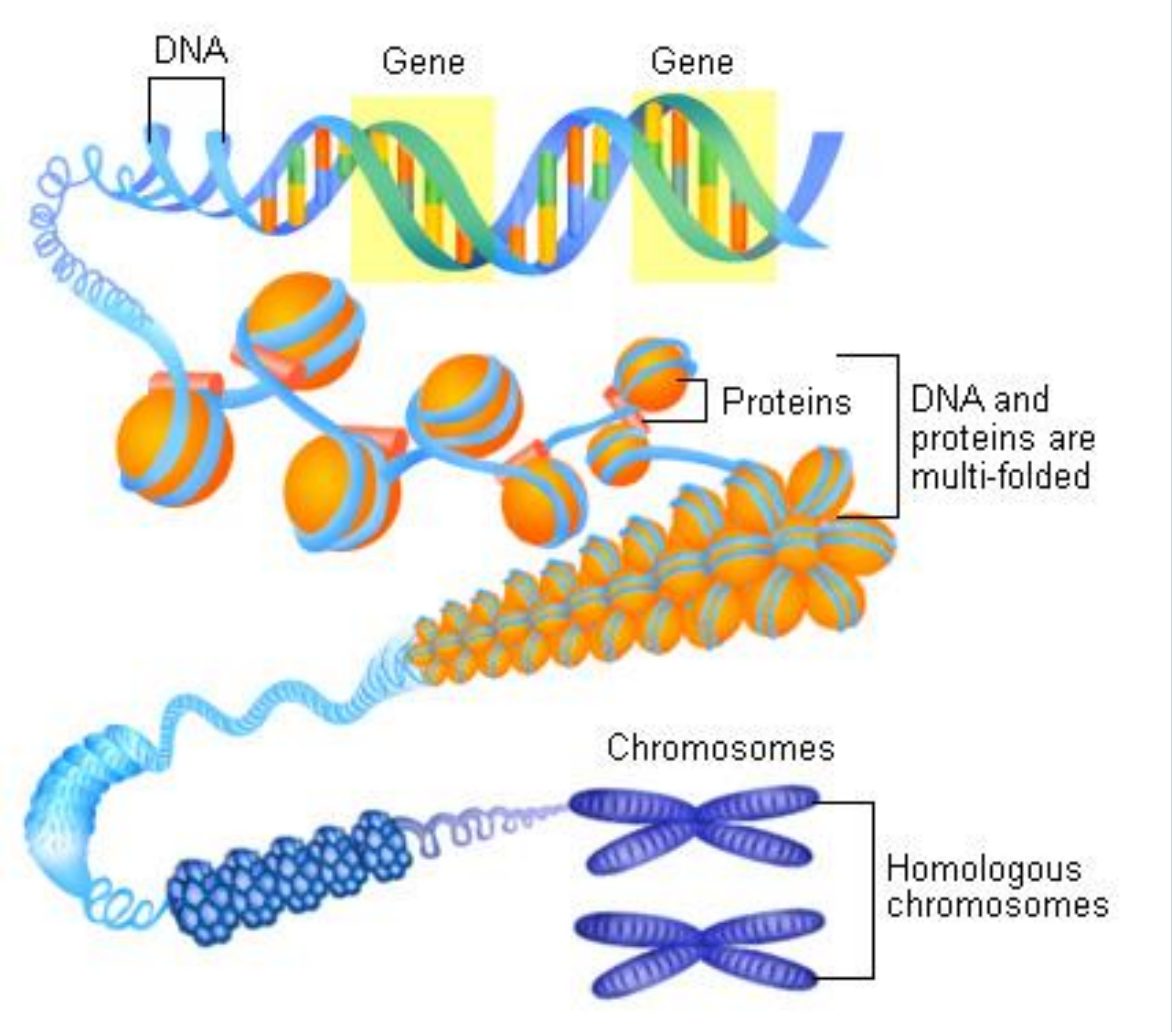


People – tissues - cells

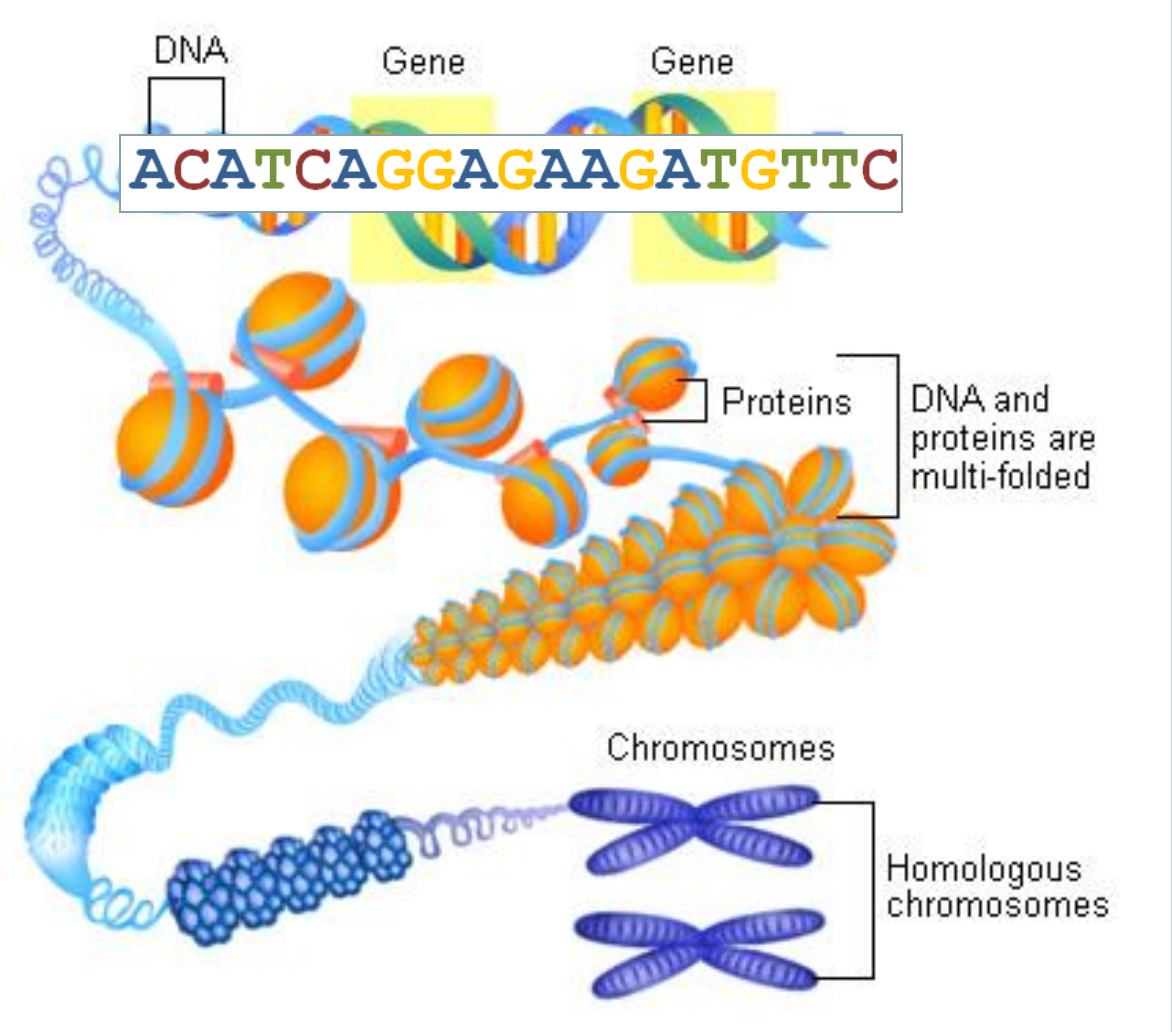
- Basic unit of function: cell
- 10 000 000 000 000 (10^{13})
- genetic material in nucleus: 23 chromosome pairs
- Very long molecules that encode information



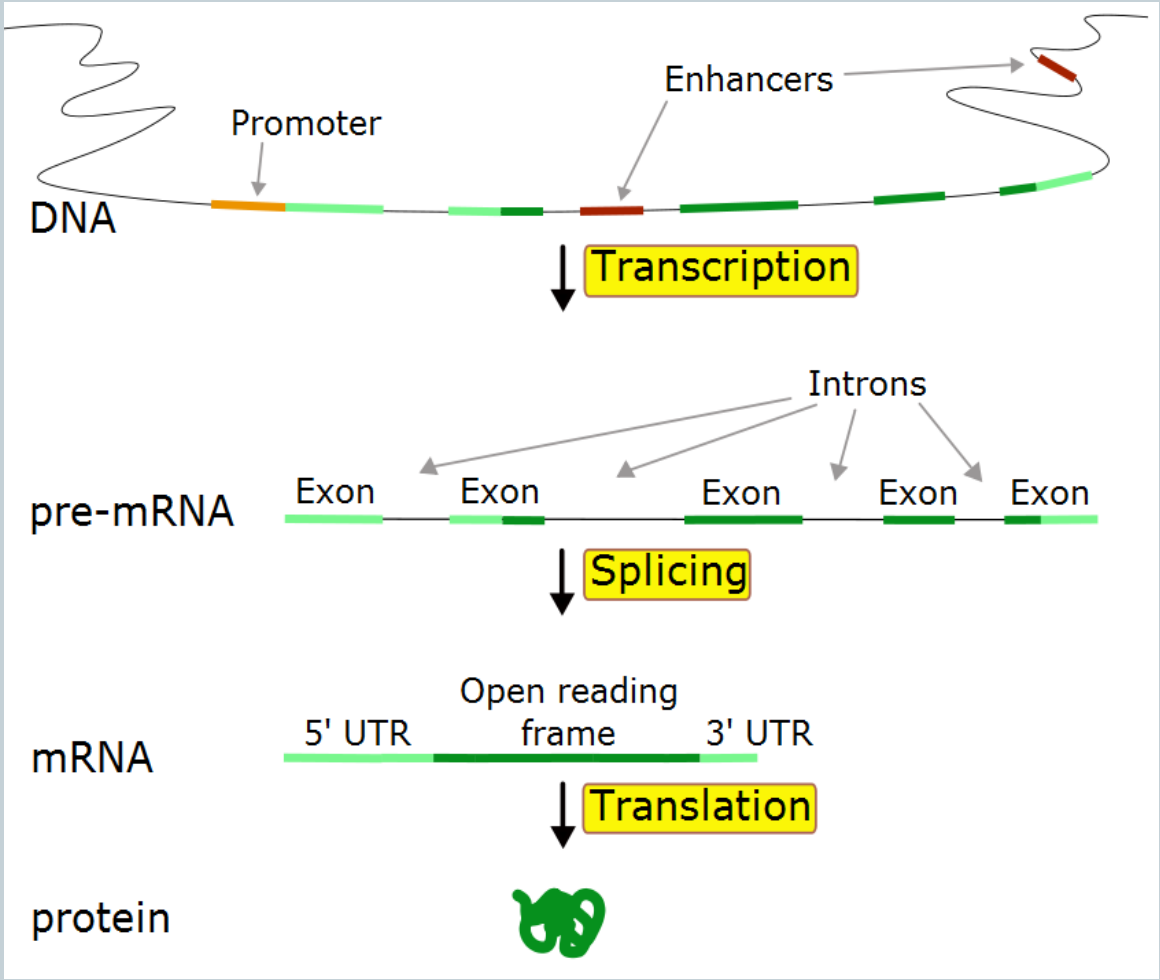
Genetic material

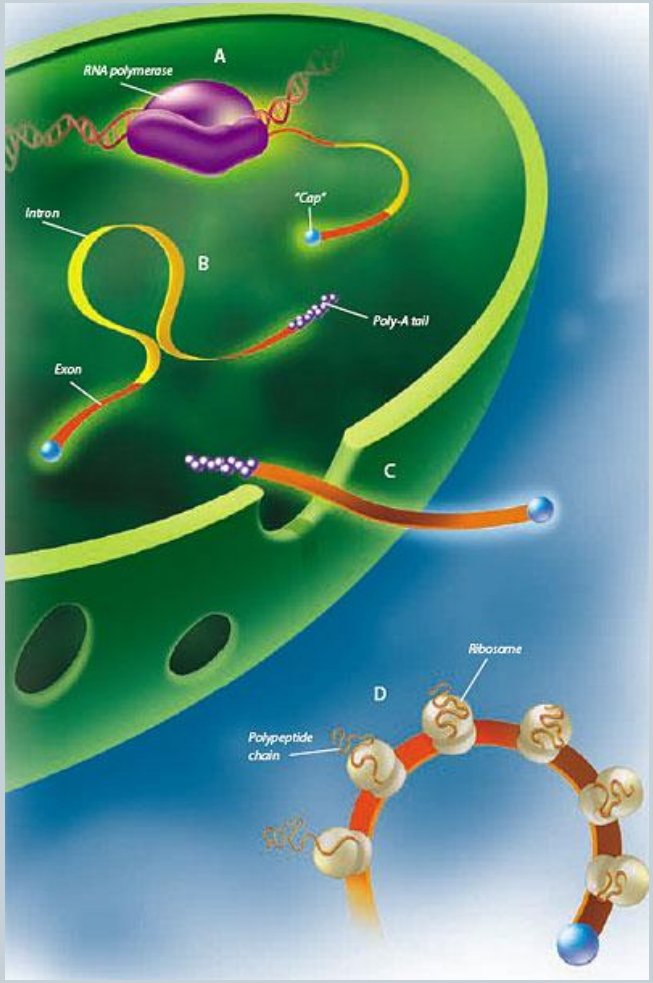


Genetic material

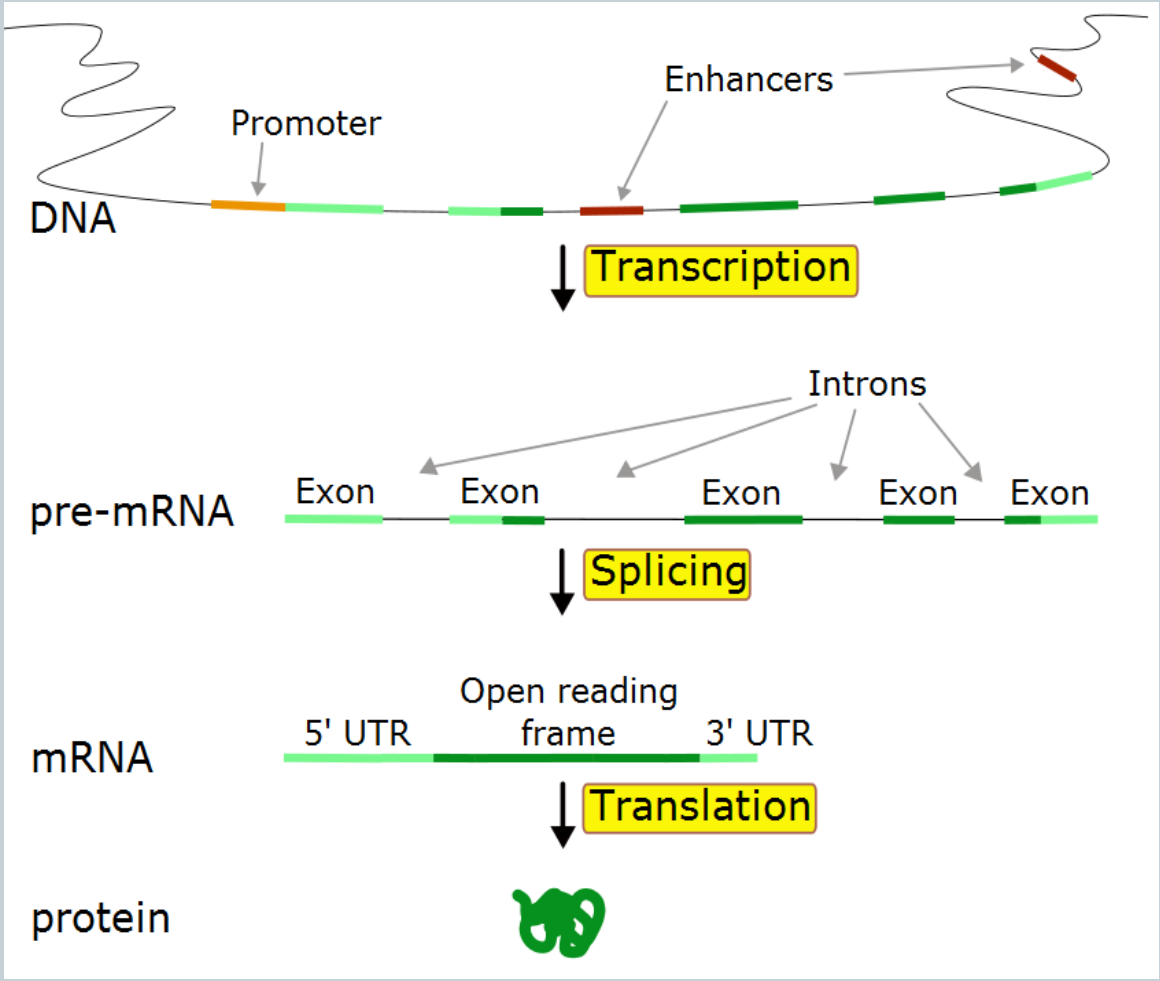


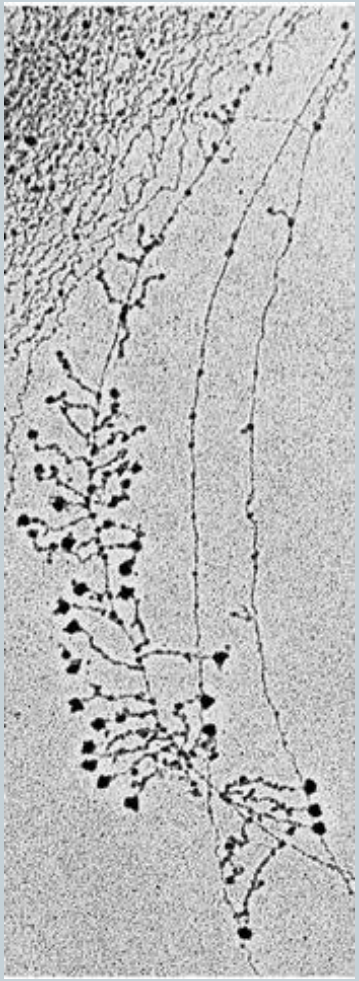
Genetic material



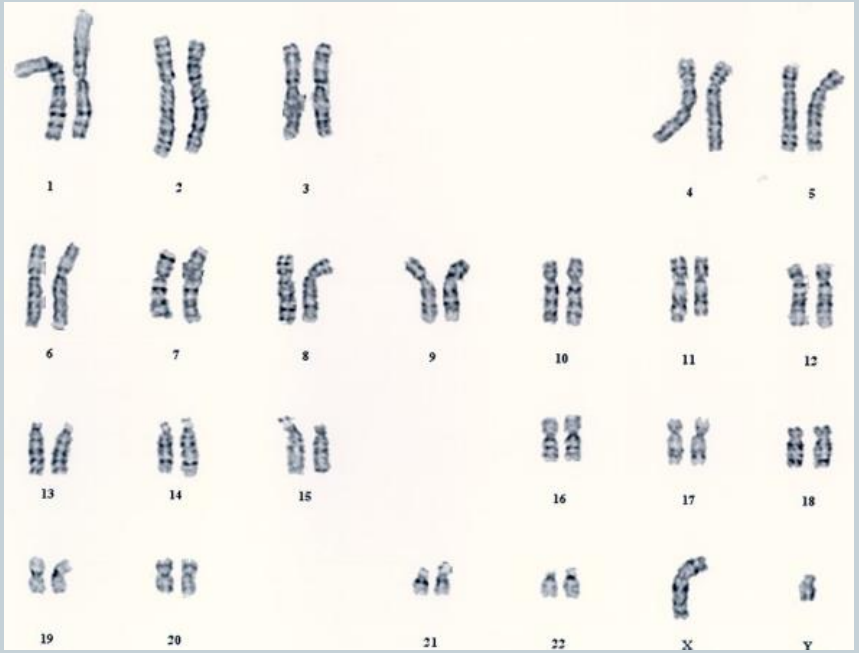


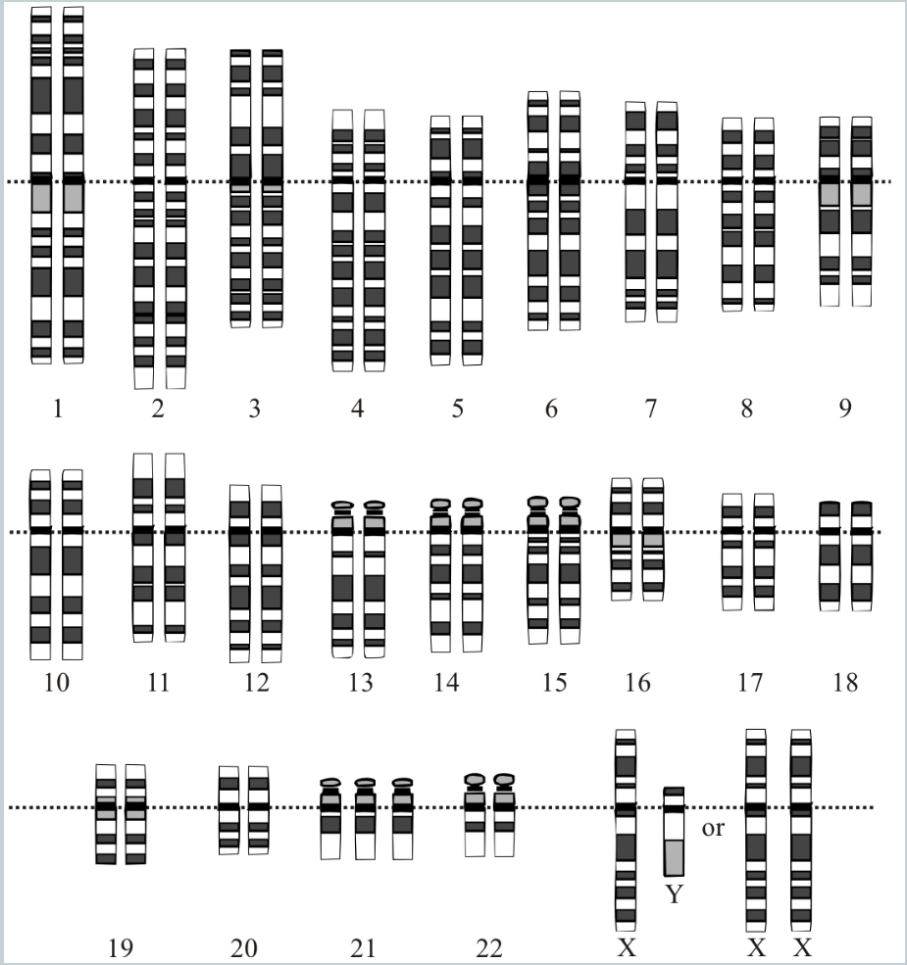
Genetic material

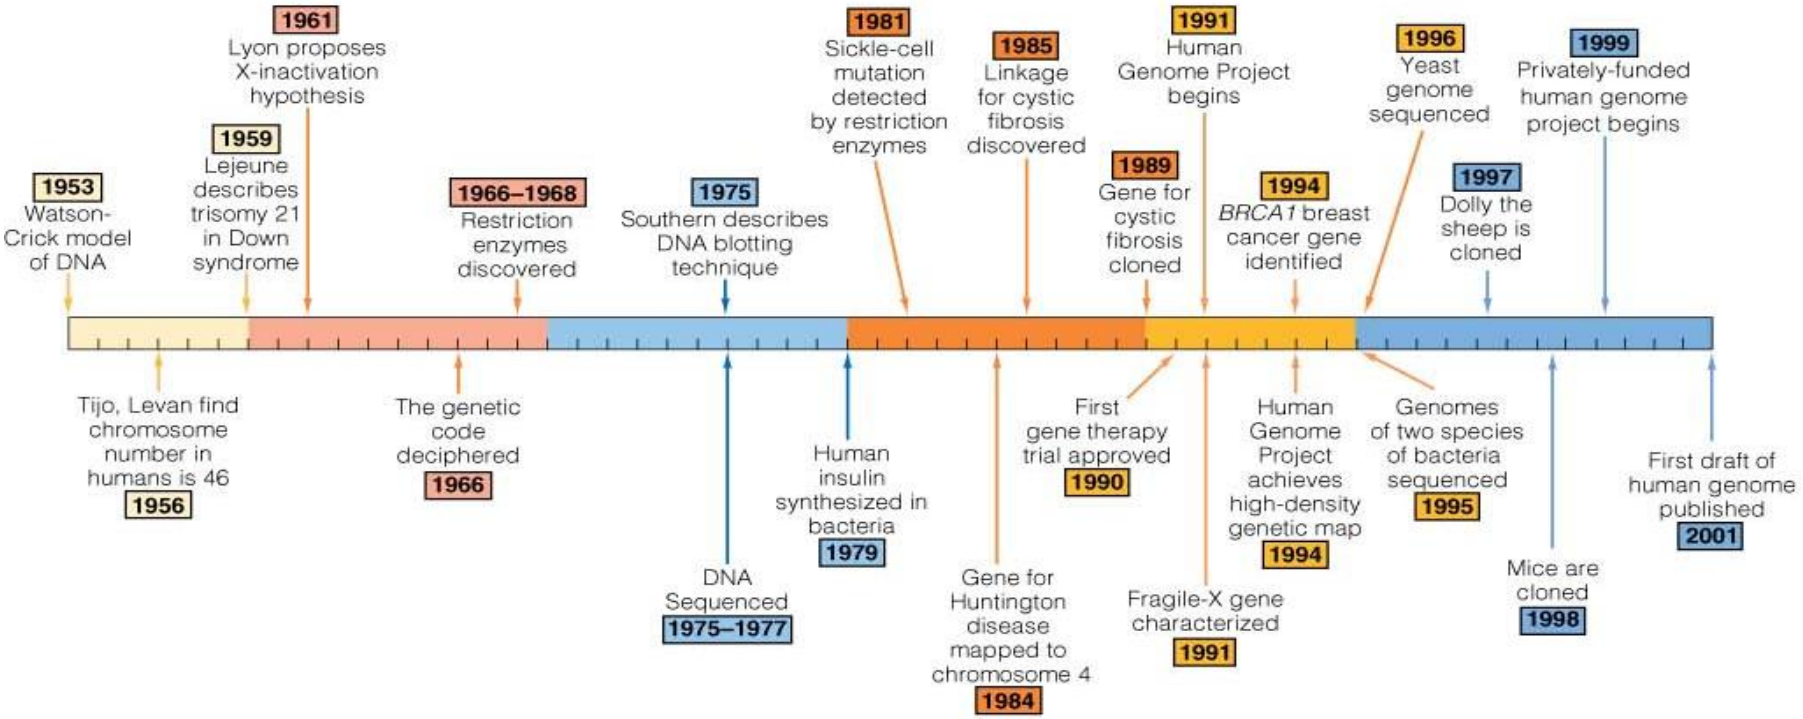




Genetic material

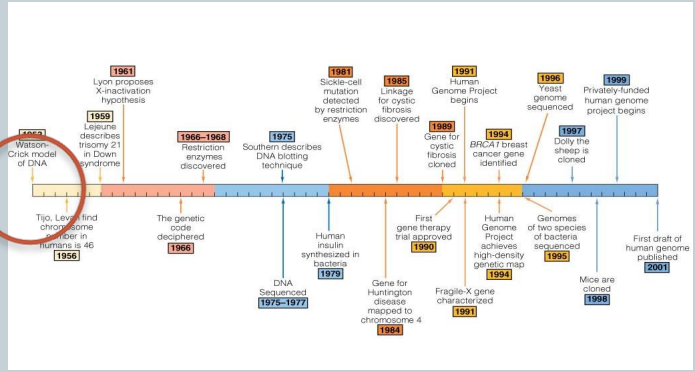


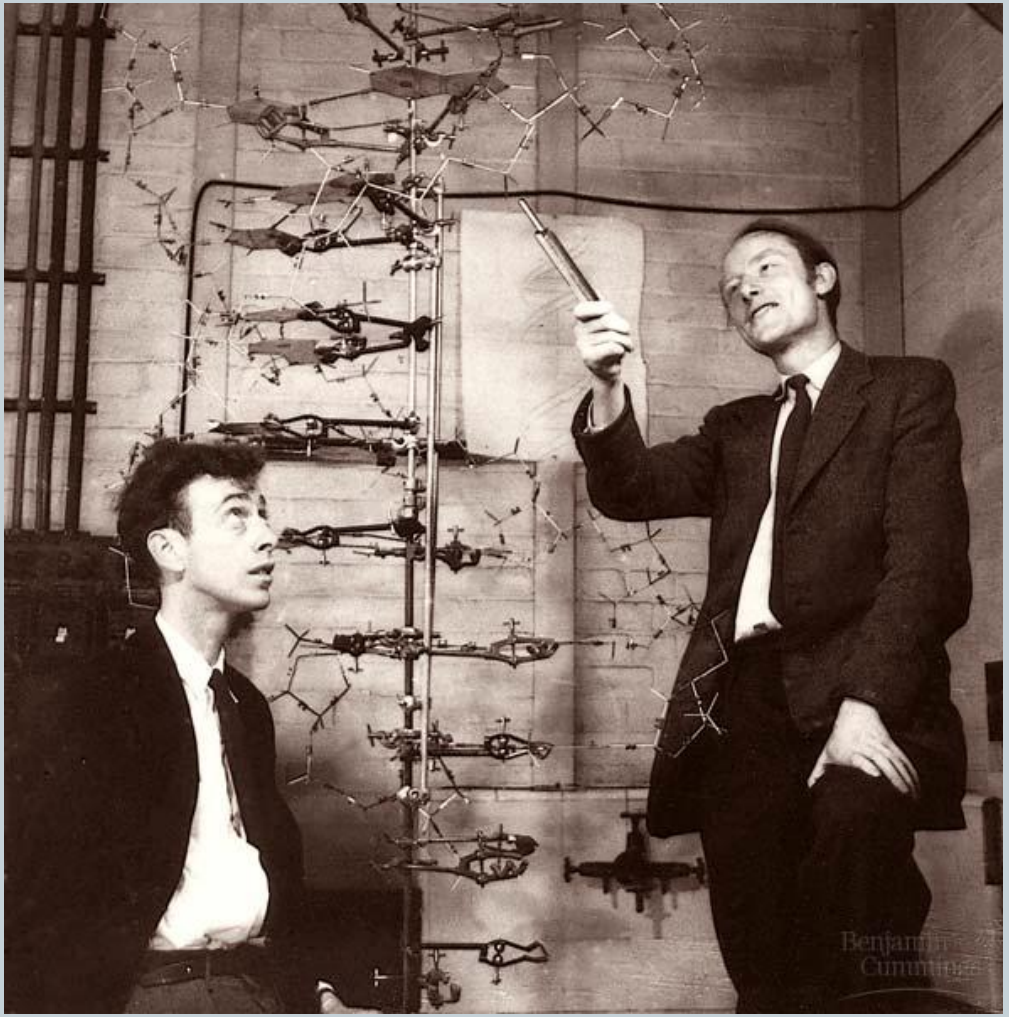




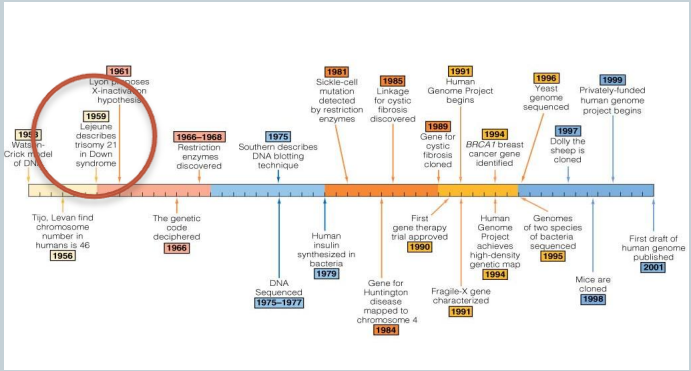
1953
Watson-Crick model of DNA
1956
Tijo, Levan find chromosome number in humans is 46
1959
Lejeune describes trisomy 21 in Down syndrome
1961
Lyon proposes X-inactivation hypothesis
1966
The genetic code deciphered
1966–1968
Restriction enzymes discovered
1975
Southern describes DNA blotting technique
1975–1977
DNA Sequenced
1979
Human insulin synthesized in bacteria
1981
Sickle-cell mutation detected by restriction enzymes
1984
Gene for Huntington disease mapped to chromosome 4
1985
Linkage for cystic fibrosis discovered
1989
Gene for cystic fibrosis cloned
1990
First gene therapy trial approved
1991
Human Genome Project begins
1991
Fragile-X gene characterized
1994
BRCA1 breast cancer gene identified
1994
Human Genome Project achieves high-density genetic map
1995
Genomes of two species of bacteria sequenced
1996
Yeast genome sequenced
1997
Dolly the sheep is cloned
1998
Mice are cloned
1999
Privately-funded human genome project begins
2001
First draft of human genome published

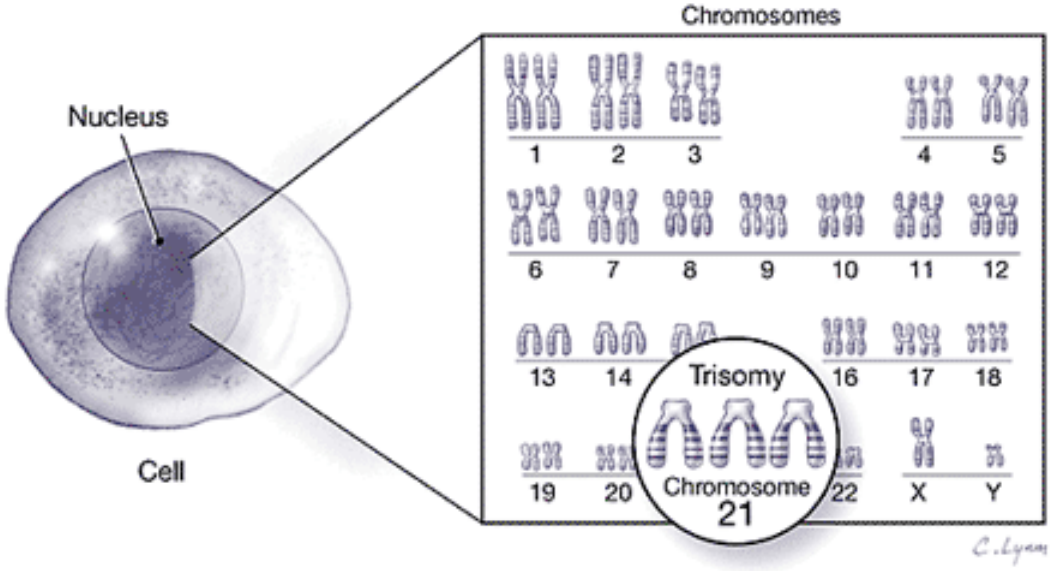
Discoveries



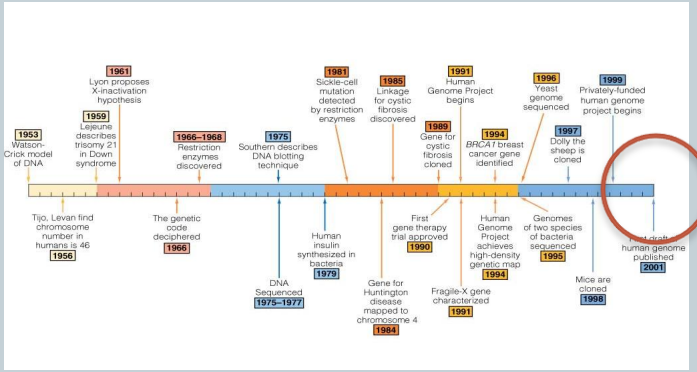


Discoveries





Discoveries



The Human Genome

- “First draft” of the human genome
- International, collabroative research project
- 90 percent of 3 billion base pairs sequenced
  - Initial draft: June 2000
  - Final draft: April 2003
  - 13 year project
  - $300 million value

The Human Genome

- “Human Genome Sequence” of just a few people
- We are all genetically different
  - From other species
  - From our ancestors
  - Between population groups
  - From the person sitting next to you

The Human Genome

- “Human Genome Sequence” of just a few people
- We are all genetically different
  - **From other species**
  - From our ancestors
  - Between population groups
  - From the person sitting next to you

Sequence similarity with other species

Homo Sapiens

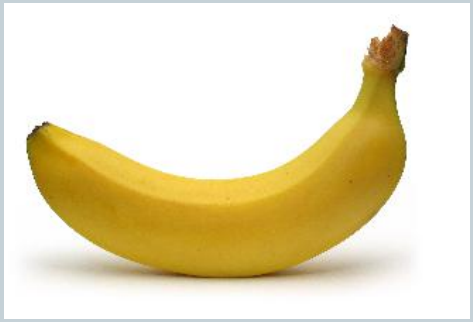
Sequence similarity with other species

Chimpanzee vs. human
sequence identity
for 130 genes (CDS):
98,30%

Sequence similarity with other species

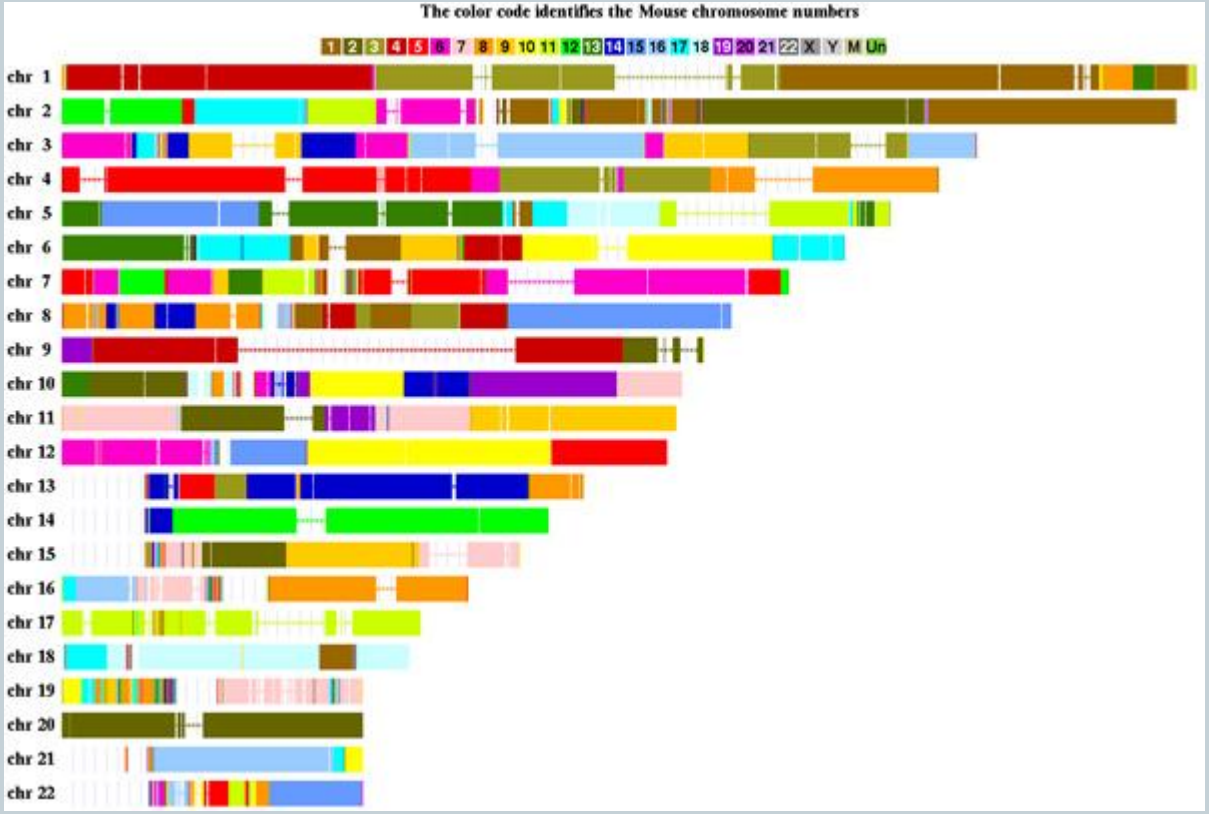
Chimpanzee vs. human
sequence identity
for 130 genes (CDS):
98,30%

50%



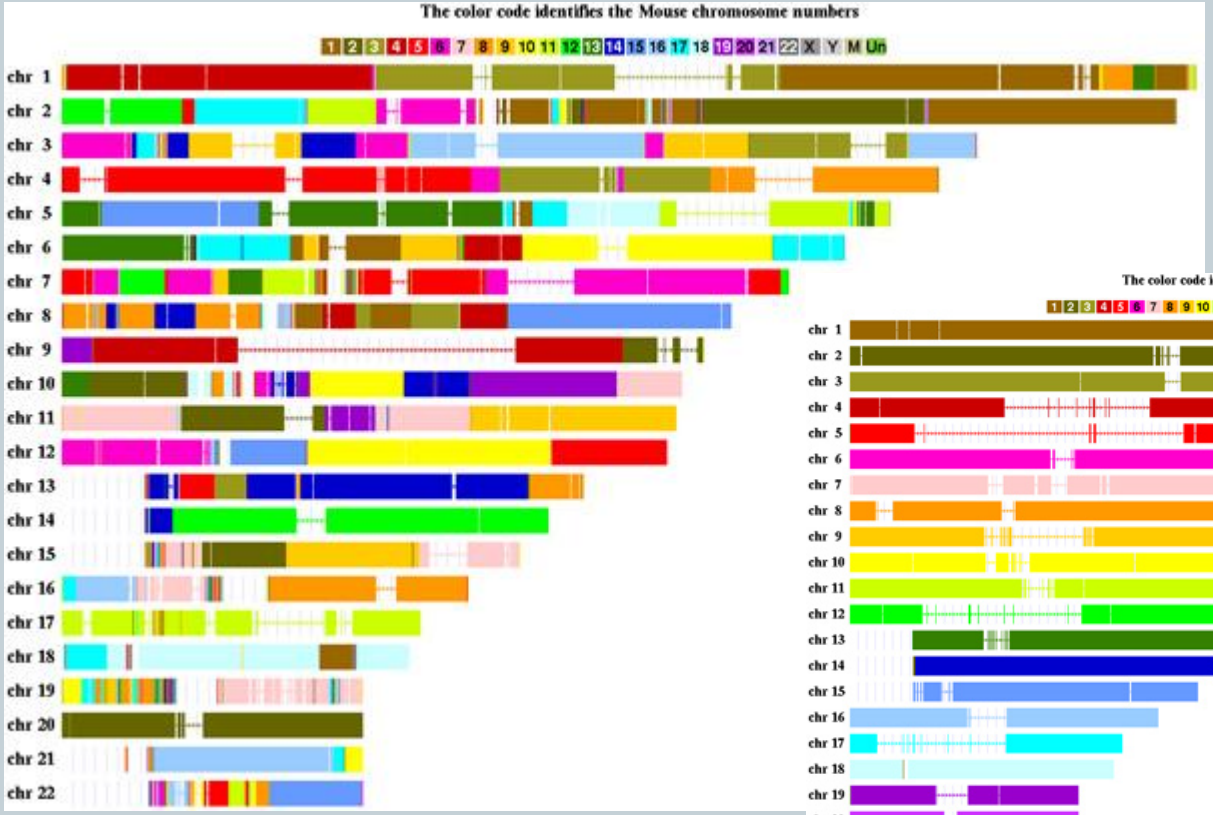
Genomes

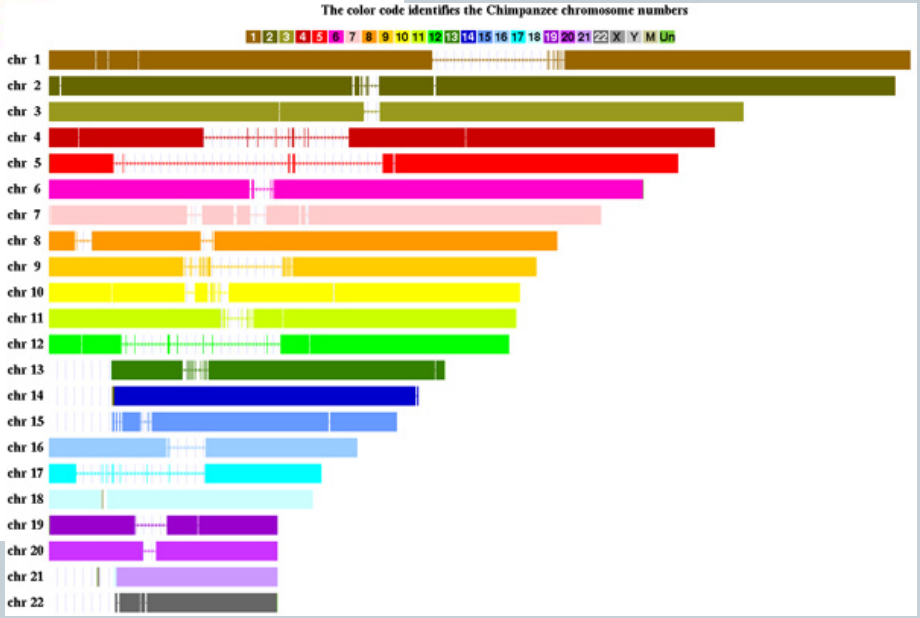
- Human vs. mouse



Genomes

- Human vs. mouse; human vs. chimpanzee





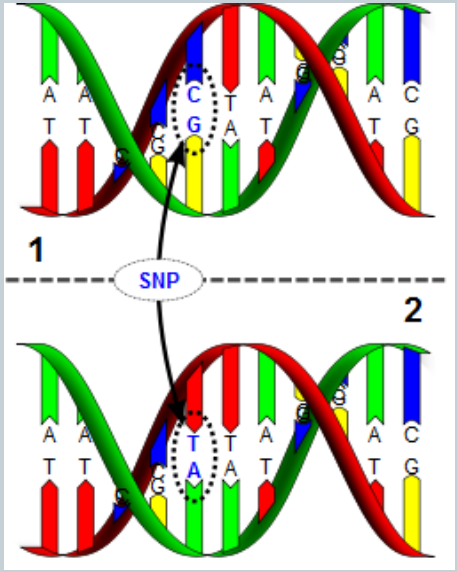
The Human Genome

- “Human Genome Sequence” of just a few people
- We are all genetically different
  - From other species
  - From our ancestors
  - Between population groups
  - **From the person sitting next to you**

Variation in the Human Genome

- **Sequence variation**

```
ACATCAGGAGAAGATGTTC GAGACTTTGCCA
ACATCAGGAGAAGATGTTT GAGACTTTGCCA
ACATCAGGAGAAGATGTT  GAGACTTTGCCA
ACATCAGGAGAAGATGTTCCGAGACTTTGCCA
```



Variation in the Human Genome

- **Sequence variation**

```
ACATCAGGAGAAGATGTTC GAGACTTTGCCA
ACATCAGGAGAAGATGTTT GAGACTTTGCCA
ACATCAGGAGAAGATGTT  GAGACTTTGCCA
ACATCAGGAGAAGATGTTCCGAGACTTTGCCA
```

  - nucleotide diversity between two people: about 0.1% (1/1000)
    - human genome: about 3 billion nucleotides
    - two random people: +/- 3 million nucleotide differences

Variation in the Human Genome

- **Sequence variation**

```
ACATCAGGAGAAGATGTTC GAGACTTTGCCA
ACATCAGGAGAAGATGTTT GAGACTTTGCCA
ACATCAGGAGAAGATGTT  GAGACTTTGCCA
ACATCAGGAGAAGATGTTCCGAGACTTTGCCA
```

Variation in the Human Genome

- **Sequence variation**

```
ACATCAGGAGAAGATGTTC GAGACTTTGCCA
ACATCAGGAGAAGATGTTT GAGACTTTGCCA
ACATCAGGAGAAGATGTT  GAGACTTTGCCA
ACATCAGGAGAAGATGTTCCGAGACTTTGCCA
```

- **Copy number variation**

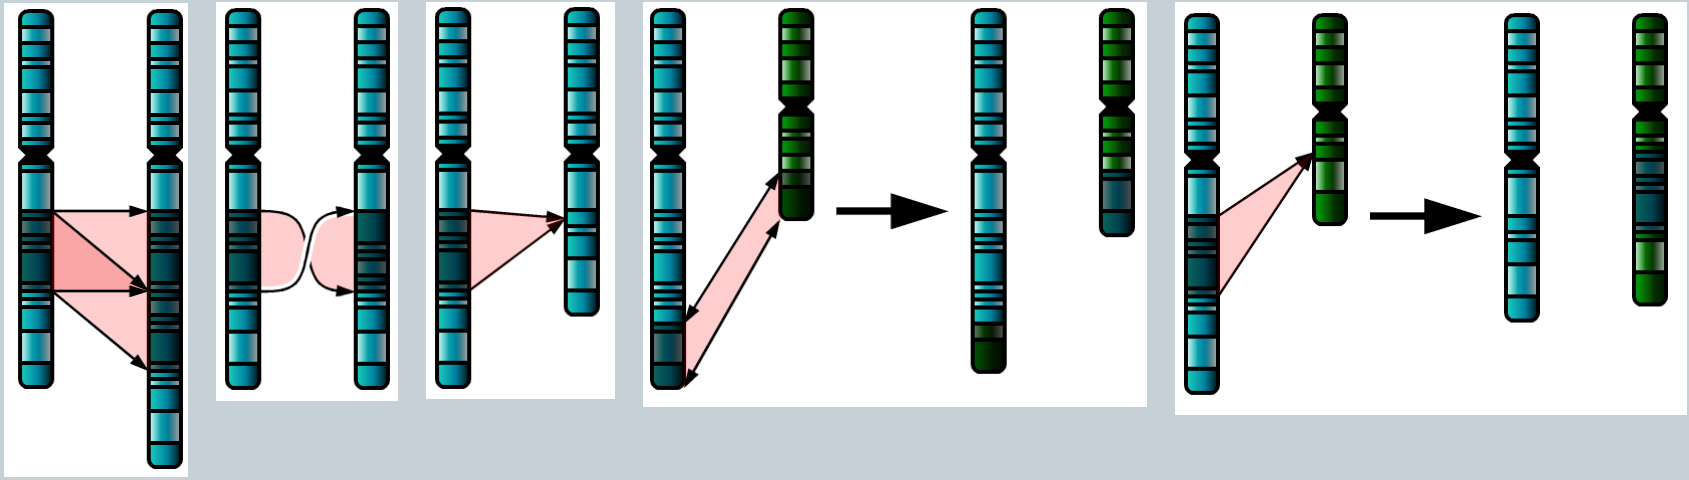
  - human to human genetic variation is estimated to be at least 0.5% (99.5% similarity)

Variation in the Human Genome

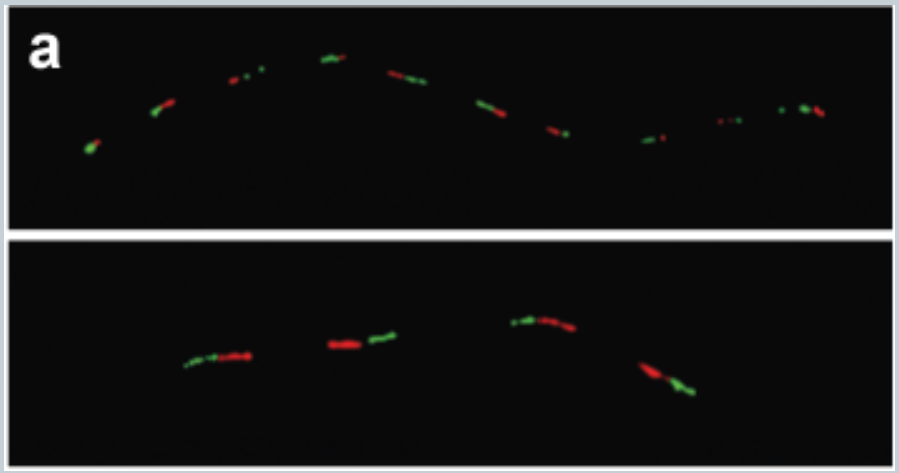
- **Sequence variation**

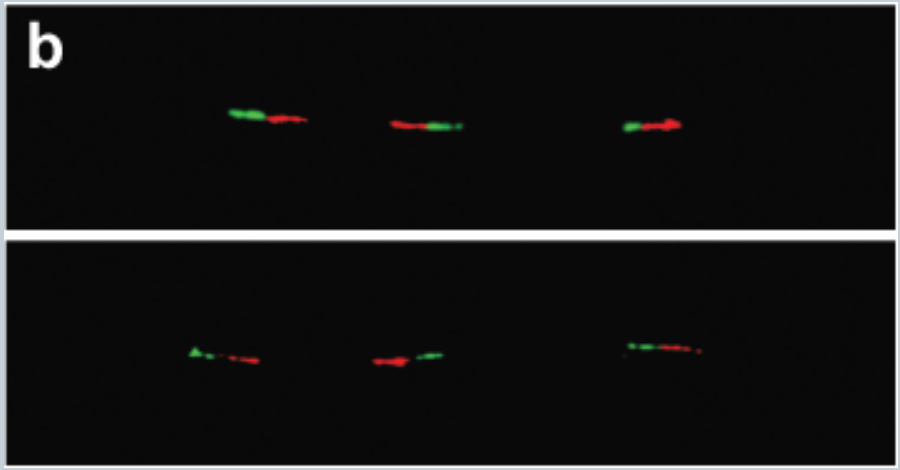
```
ACATCAGGAGAAGATGTTC GAGACTTTGCCA
ACATCAGGAGAAGATGTTT GAGACTTTGCCA
ACATCAGGAGAAGATGTT  GAGACTTTGCCA
ACATCAGGAGAAGATGTTCCGAGACTTTGCCA
```

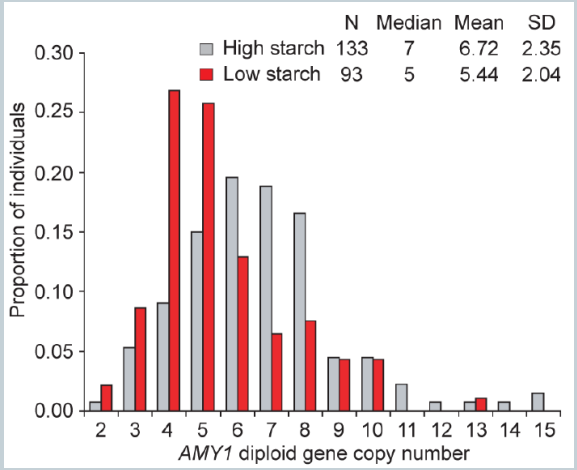
- **Copy number variation**



Human Genome Copy Number Variation







Perry *et al.*

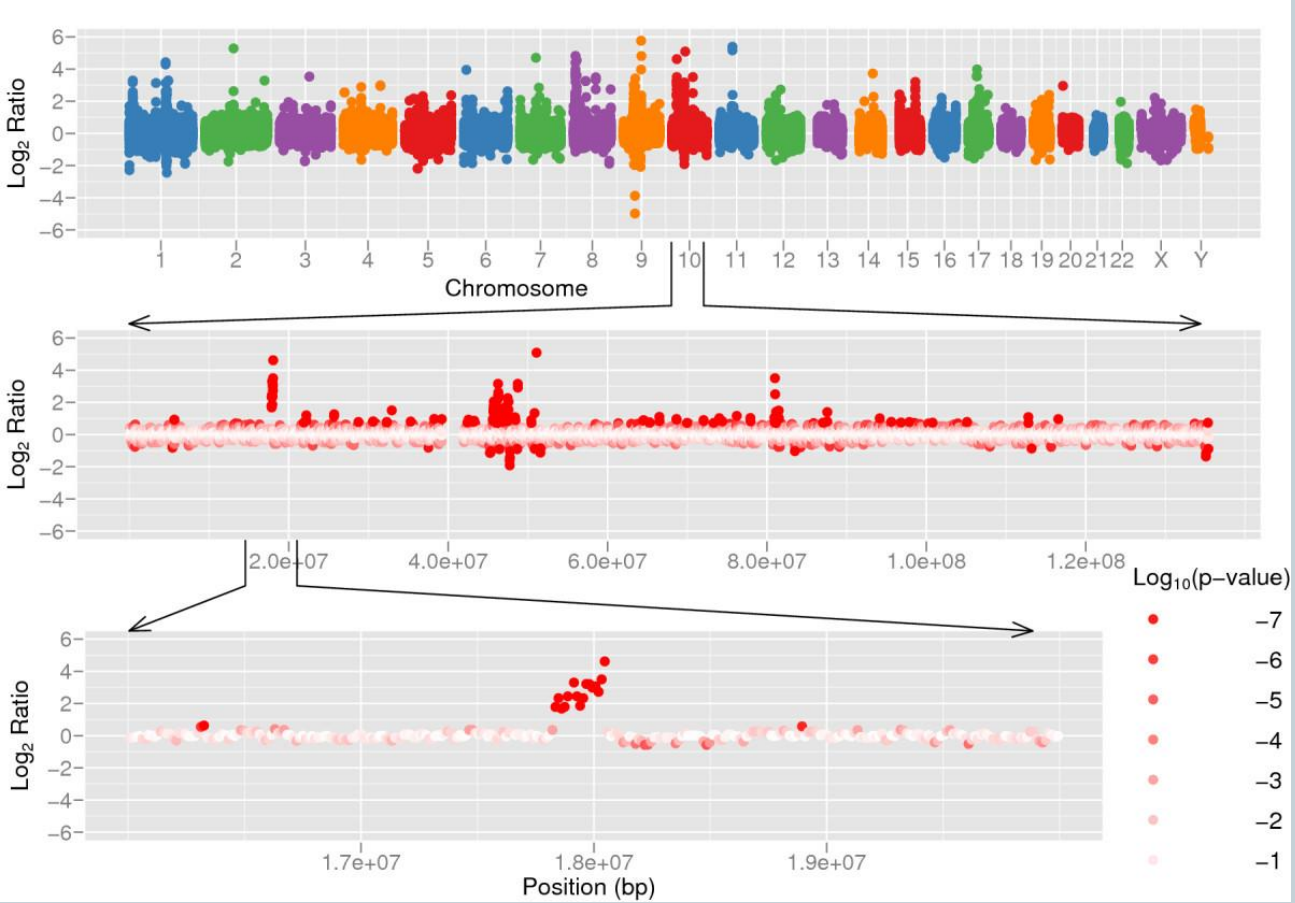
Variation in the Human Genome

- Because of the higher resolution of the new systems, we will uncover larger numbers of smaller variants

Wellcome Trust Sanger Institute

Variation in the Human Genome

- Venter vs. Watson



Xie *et al.*

Chapter 1 – introduction and context

TECHNIQUE, CHALLENGES AND DATA SOURCES

Chapter 1 – introduction and context

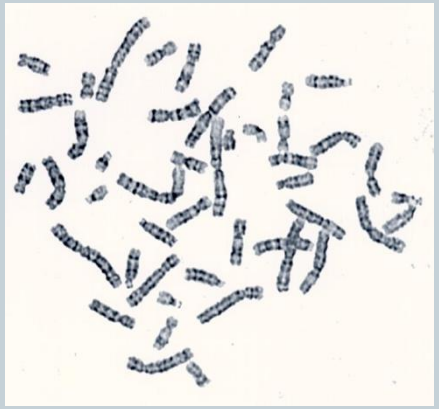
- The Array-CGH technique
- Challenges and data sources
  - Raw data analysis
  - Downstream analysis: interpretation in context
    - Gene function
    - Phenotypes
    - Information from text mining
    - …

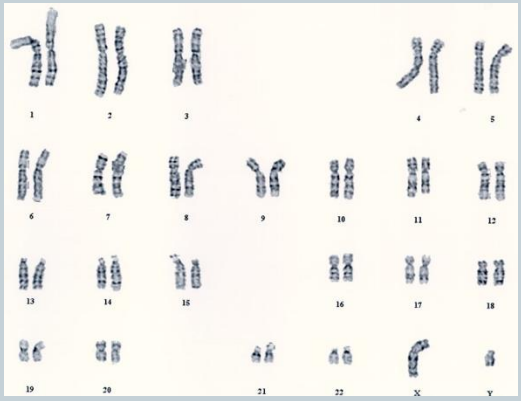
Chapter 1 – introduction and context

- **The Array-CGH technique**
- Challenges and data sources
  - Raw data analysis
  - Downstream analysis: interpretation in context
    - Gene function
    - Phenotypes
    - Information from text mining
    - …

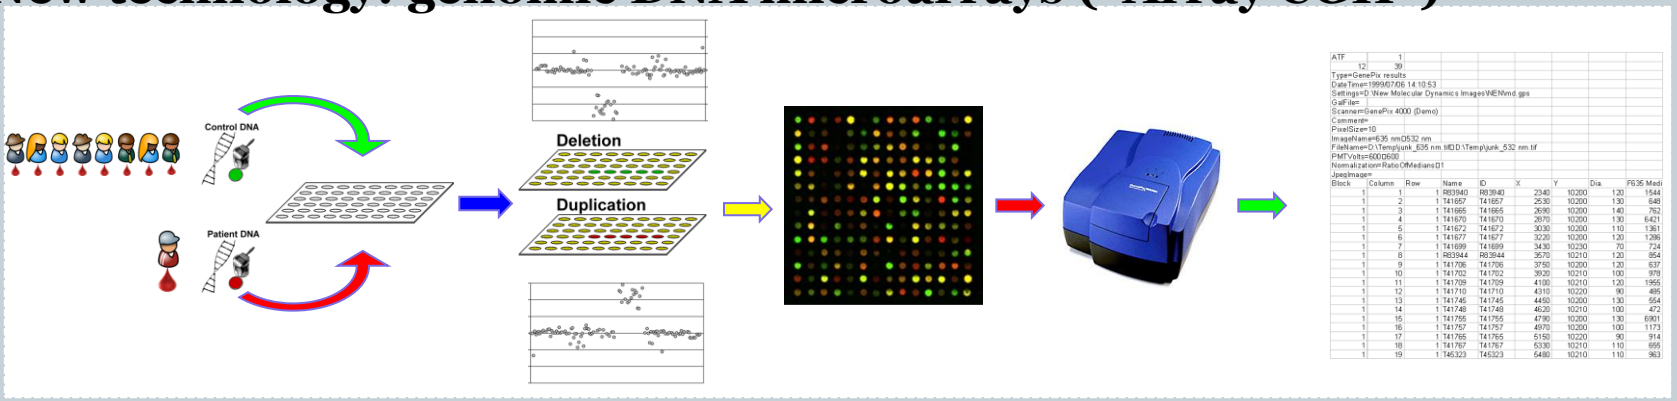
Clinical Cytogenetics

Classical technique: band stain karyotyping

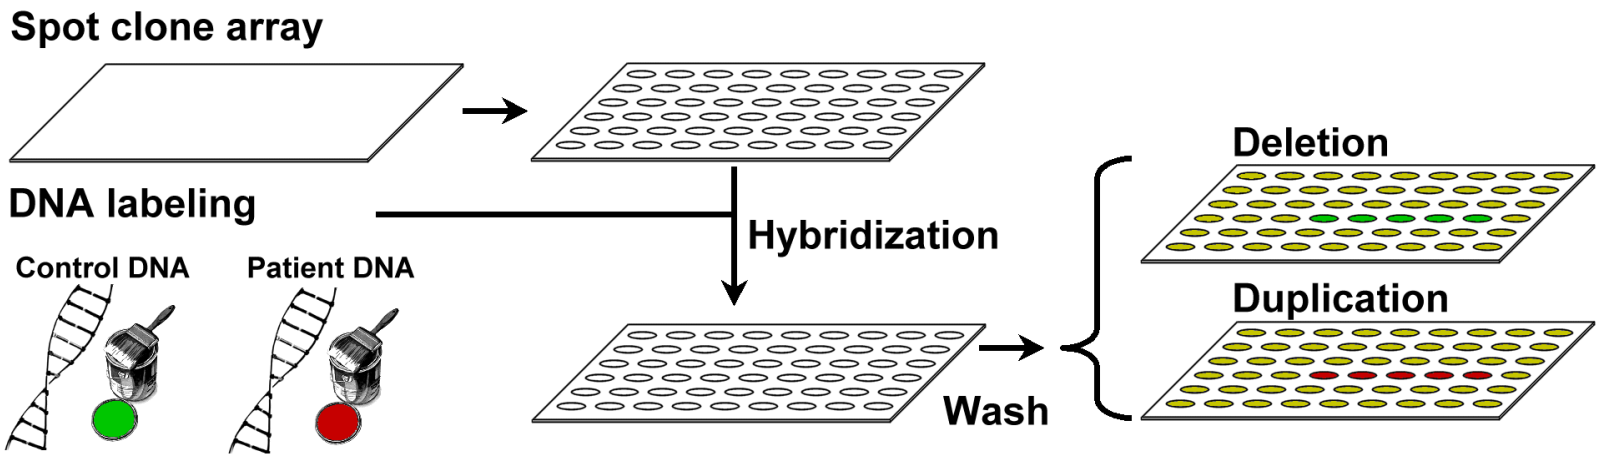


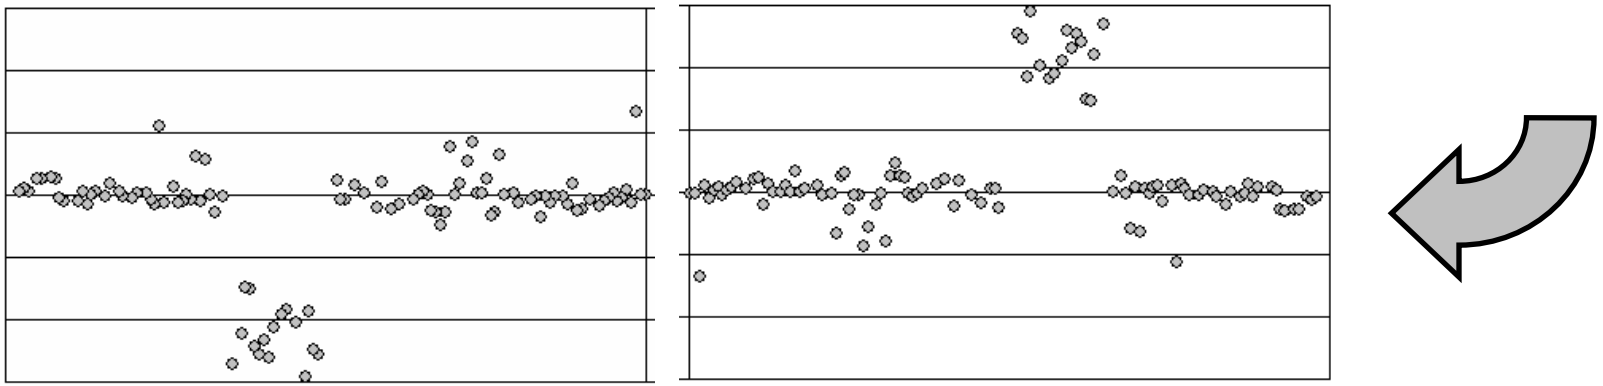


New technology: genomic DNA microarrays ("Array CGH")



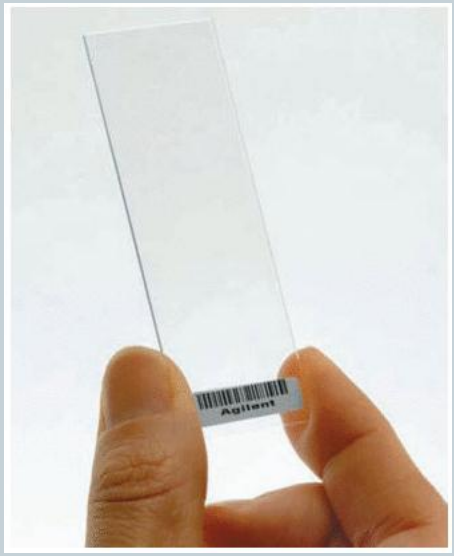
DNA microarray experiments





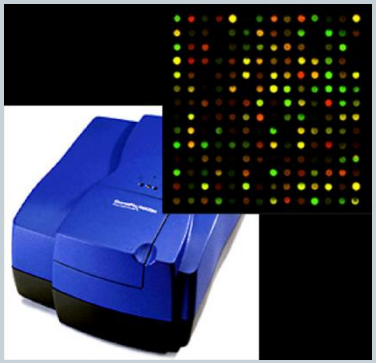
DNA microarray experiments

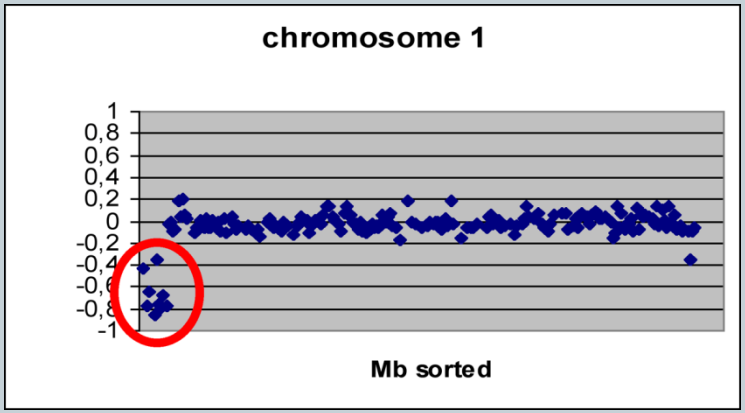
- Microarray slides



Cytogenetics Diagnosis

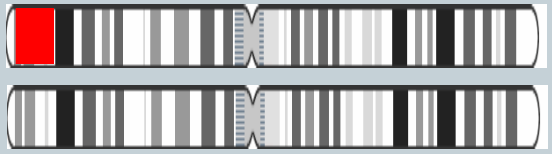
Patient with developmental anomaly





- 2-3% of live births with major congenital anomaly
- Medical & social impact of diagnosis
  - Reduce family distress – end of "diagnostic odyssey"
  - Estimate risk of recurrence for next pregnancy
  - Prevent clinical complications – life planning

- Array CGH is superior to previous technology
  - ++ resolution, + speed, +/- cost
  - Rapid adoption by cytogenetics labs
- ! Need for tools to manage efficiently the flood of genetic information in a *routine clinical* setting



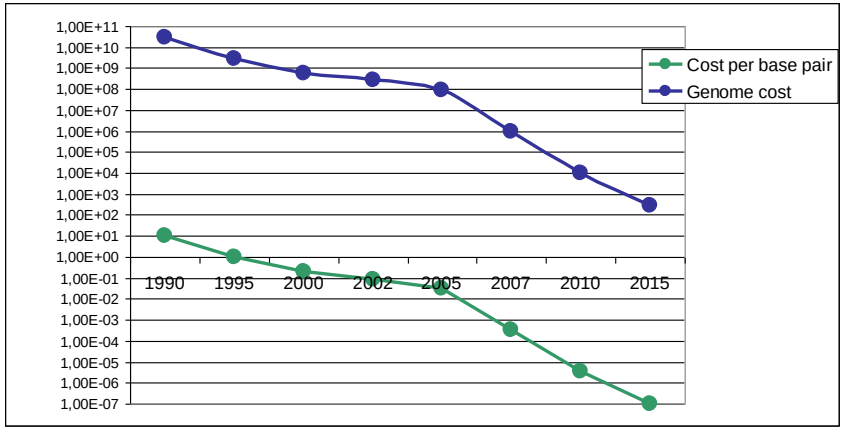
Detected genetic anomaly

Chapter 1 – introduction and context

- The Array-CGH technique
- **Challenges and data sources**
  - Raw data analysis
  - Downstream analysis: interpretation in context
    - Gene function
    - Phenotypes
    - Information from text mining
    - …

The 1000 $ Genome

- **Human genome project**
  - Initial draft: June 2000
  - Final draft: April 2003
  - 13 year project
  - $300 million value with 2002 technology
- **Personal genome**
  - June 1, 2007
  - Genome of James Watson, co-discoverer of DNA double helix, is sequenced
    - $1.000.000
    - Two months
- **€50.000-genome**
  - Available (CG: 5000 €)
- **€1000-genome**
  - Expected



Year	Cost per base pair	Genome cost
1990	10	3E+10
1995	1	3.000.000.000
2000	0.2	600.000.000
2002	0.09	270.000.000
2005	0.03	90.000.000
2007	0.000333333	1.000.000
2010	3.33333E-06	10000
2015	0.0000001	300

Chapter 2 – Array CGH data management and analysis

RAW ANALYSIS, EXPERIMENT DESIGN, AND GENOME POLYMORPHISM

Chapter 2 – Array CGH data management and analysis

- Raw data analysis : quality criteria and pitfalls
  - Data normalization
  - Spot and aberration calling (segmentation)
  - Threshold definition
- Alternative array design (loop analysis)
  - Joke Allemeersch credited for statistical models
  - LOOP tool: web architecture for data management
- Benign copy number variation analysis (clone wars)
- Importance of data management
  - Data repositories that feature analysis tools
  - Examples: ArrayCGHBase, Decipher, Store+Bench, Database of Genomic Variants, ECARUCA, …

Chapter 2 – Array CGH data management and analysis

- Raw data analysis : quality criteria and pitfalls
  - Data normalization
  - Spot and aberration calling (segmentation)
  - Threshold definition
- Alternative array design (loop analysis)
  - Joke Allemeersch credited for statistical models
  - **LOOP tool: web architecture for data management**
- Benign copy number variation analysis (clone wars)
- Importance of data management
  - Data repositories that feature analysis tools
  - Examples: ArrayCGHBase, Decipher, Store+Bench, Database of Genomic Variants, ECARUCA, …

LOOP and Clone Wars

- Database for storing experiments
- Slide Annotation
- Visualisation
- Normalisation
- Statistical method for analysis (LIMMA)

Upload .gpr
Add .gpr · View Slides · View Loop Designs · Log on · Log off
On this page, you can add a single .gpr file to the slide repository. Files are added one at a time. You can combine multiple slides into a loop design later on.
Adding a slide to the repository
Question 1 - Where can I find the .gpr-file?
d:\431457.gpr
Bladeren...
Question 2 - Who conducted the experiment?
Cindy Melotte
Cindy
Question 3 - When was the experiment conducted?
May 1, 2006
Question 4 - Please provide a reference for your Cy5 sample[1].
patient 4687
Question 5 - Please provide a reference for your Cy3 sample[1].
patient 4645
Question 6 - Below, you can add comments to this slide, if necessary.
hybr ok
To store the slide into the repository[2], press Add.
Add
[1] It is important for this reference to be correct. The system will use it to infer how loop designs are set up.
[2] Please note that entering a slide into the repository can take some time, as .gpr-files are rather large.

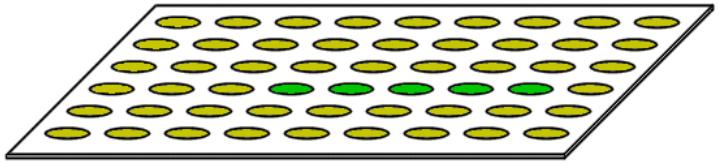
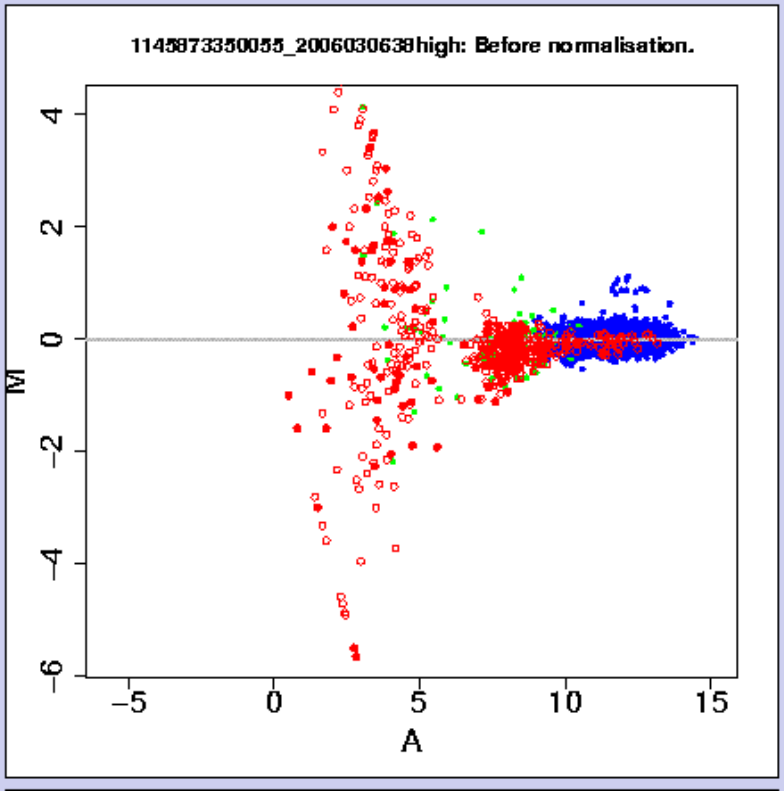
A second indication for the array quality is the number of spots above background. Here, we call a spot above background if Fg>Bg+2*sd(Bg). In the table, the number and percentage of the spots that are above background, is shown; for both channels combined, and for the green and red channel separately.

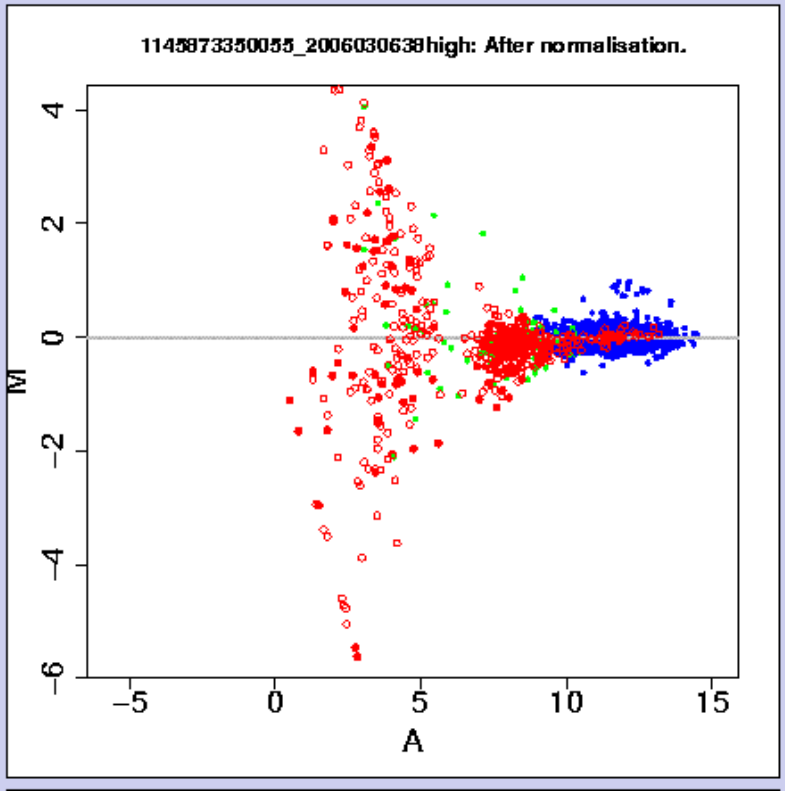
Hybridisation	# in both Channels	% in both channels	# in Red channel	% in Red channel	# in Green channel	% in Green channel
1145873350055_2006030638high	7237	97.903	7273	98.39	7255	98.147
1145873308564_2006022739low	7237	97.903	7252	98.106	7274	98.404
1145874721953_2006030638low	6931	93.764	6964	94.21	7008	94.805
For 282913 combined	7156	96.807	7203	97.443	7193	97.308
For 318719 combined	6855	92.735	6902	93.371	6944	93.939
For 79162 combined	6861	92.817	6925	93.682	6936	93.831



Spatial Loess normalization.

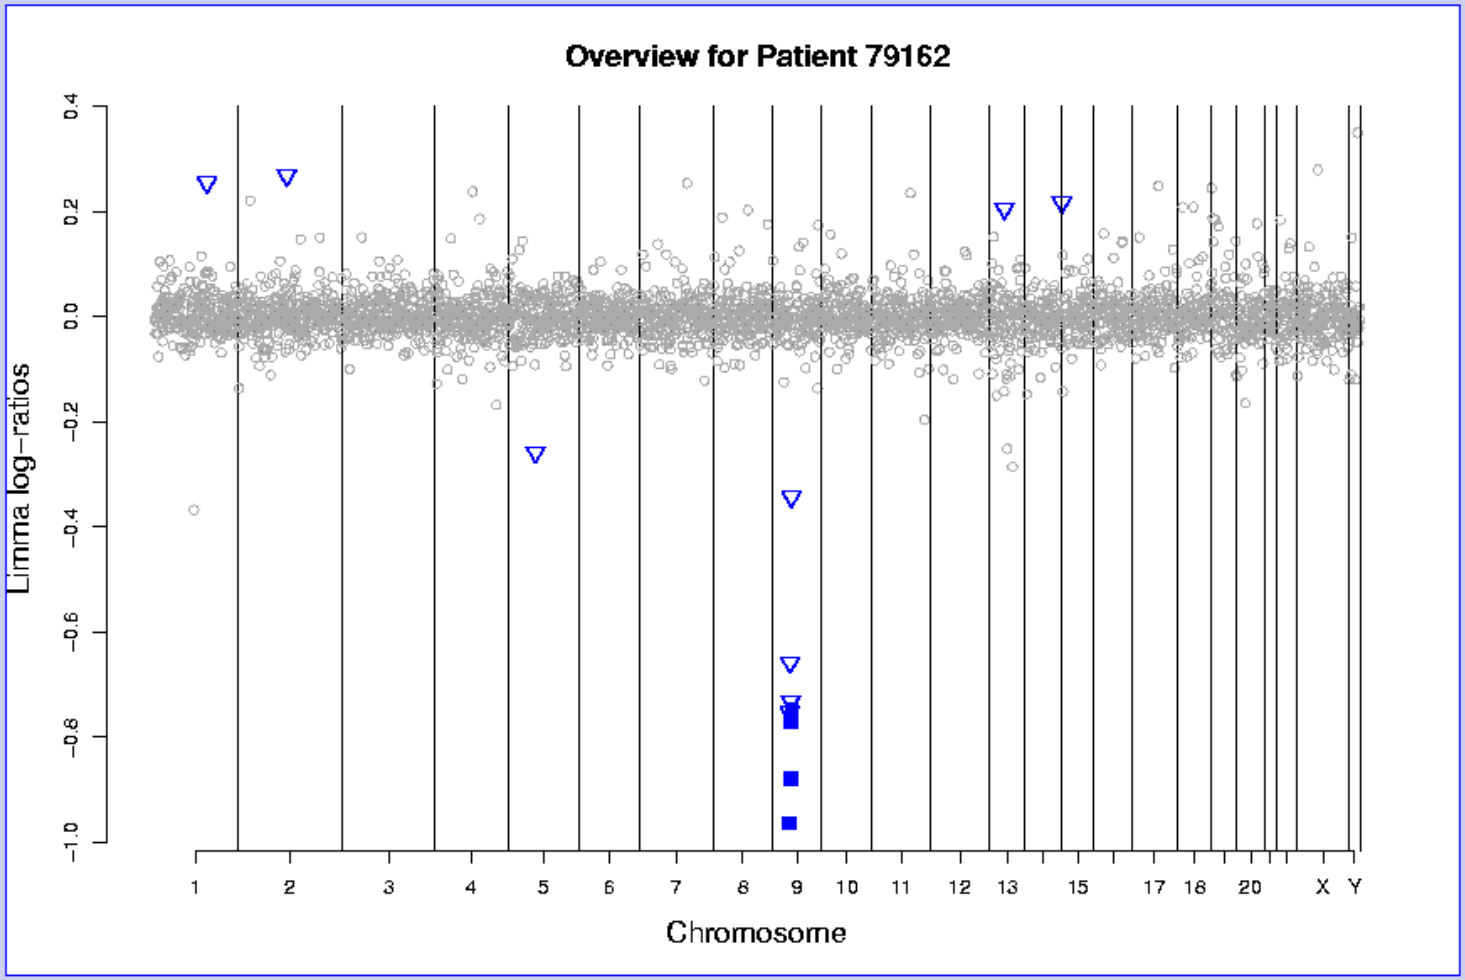
For all hybridisations, the MA plots are shown before and after the spatial Loess normalisation is performed. The measurements in the MA-plots are colored blue if they are above background and green if they are below. The empty spots are colored red.





The significant clones obtained with the Limma techniques:

This plot shows the average of the Limma-estimates for the different clones, ordered according to their chromosome location. Grey spots are not classified as deleted or duplicated for this specific patient. The colored clones are duplicated or deleted for patient 79162. In case they are likely to be partially deleted/duplicated, i.e. significantly below 0.86 or 0.54, respectively, in absolute value, they are drawn as a triangle.



Chapter 2 – Array CGH data management and analysis

- Raw data analysis : quality criteria and pitfalls
  - Data normalization
  - Spot and aberration calling (segmentation)
  - Threshold definition
- Alternative array design (loop analysis)
  - Joke Allemeersch credited for statistical models
  - LOOP tool: web architecture for data management
- **Benign copy number variation analysis (clone wars)**
- Importance of data management
  - Data repositories that feature analysis tools
  - Examples: ArrayCGHBase, Decipher, Store+Bench, Database of Genomic Variants, ECARUCA, …

Prenatal detection of a de novo terminal inverted duplication 4p in a fetus with the Wolf-Hirschhorn syndrome phenotype.

Beaujard MP, Jouannic JM, Bessieres B, Borie C, Martin-Luis I, Fallet-Bianco C, Portnoi MF.

Laboratoire de Cytogenetique, Institut de Puericulture, Paris, France.

OBJECTIVES: To present the prenatal diagnosis of a de novo terminal inversion duplication of the short arm of chromosome 4 and a review of the literature. CASE: An amniocentesis for chromosome analysis was performed at 33 weeks' gestation because ultrasound examination showed a female fetus with multiple abnormalities consisting of severe intrauterine growth retardation, microcephaly, a cleft lip and renal hypoplasia. RESULTS: Cytogenetic analysis and FISH studies of the cultured amniocytes revealed a de novo terminal inversion duplication of the short arm of chromosome 4 characterized by a duplication of 4p14-p16.1 chromosome region concomitant with a terminal deletion 4p16.1-pter. The karyotype was thus: 46,XX, inv dup del (4)(:p14-->p16.1::p16.1-->qter). The parents opted to terminate the pregnancy. Fetopathological examination showed dysmorphic features and abnormalities consistent with a Wolf-Hirschhorn syndrome (WHS) diagnosis, clinical manifestations of partial 4p trisomy being mild. CONCLUSION: Although relatively rare, inverted duplications have been reported repeatedly in an increasing number of chromosomes. Only two previous cases with de novo inv dup del (4p) and one with tandem dup 4p have been reported, all of them associated with a 4pter deletion. We report the first case diagnosed prenatally. Breakpoints are variable, resulting in different abnormal phenotype. In our case, clinical manifestations resulted in a WHS phenotype.

Wel(l)come

Welcome to the Text Based Prioritization Validation Application. If you are not part of EBI, Sanger or ESAT, you probably should go somewhere else.

This tool is under construction and shows text based gene profiling for human dysmorphy. Either choose a gene or a concept.

Examples:

- Microcephalin (MCPH1): ENSG00000147316
- Lissencephaly (LIS1): ENSG00000007168
- WHS Candidate 1 (WHSC1): ENSG00000109685
- SOTOS (NSD1): ENSG00000165671

[Contact] me about this tool.

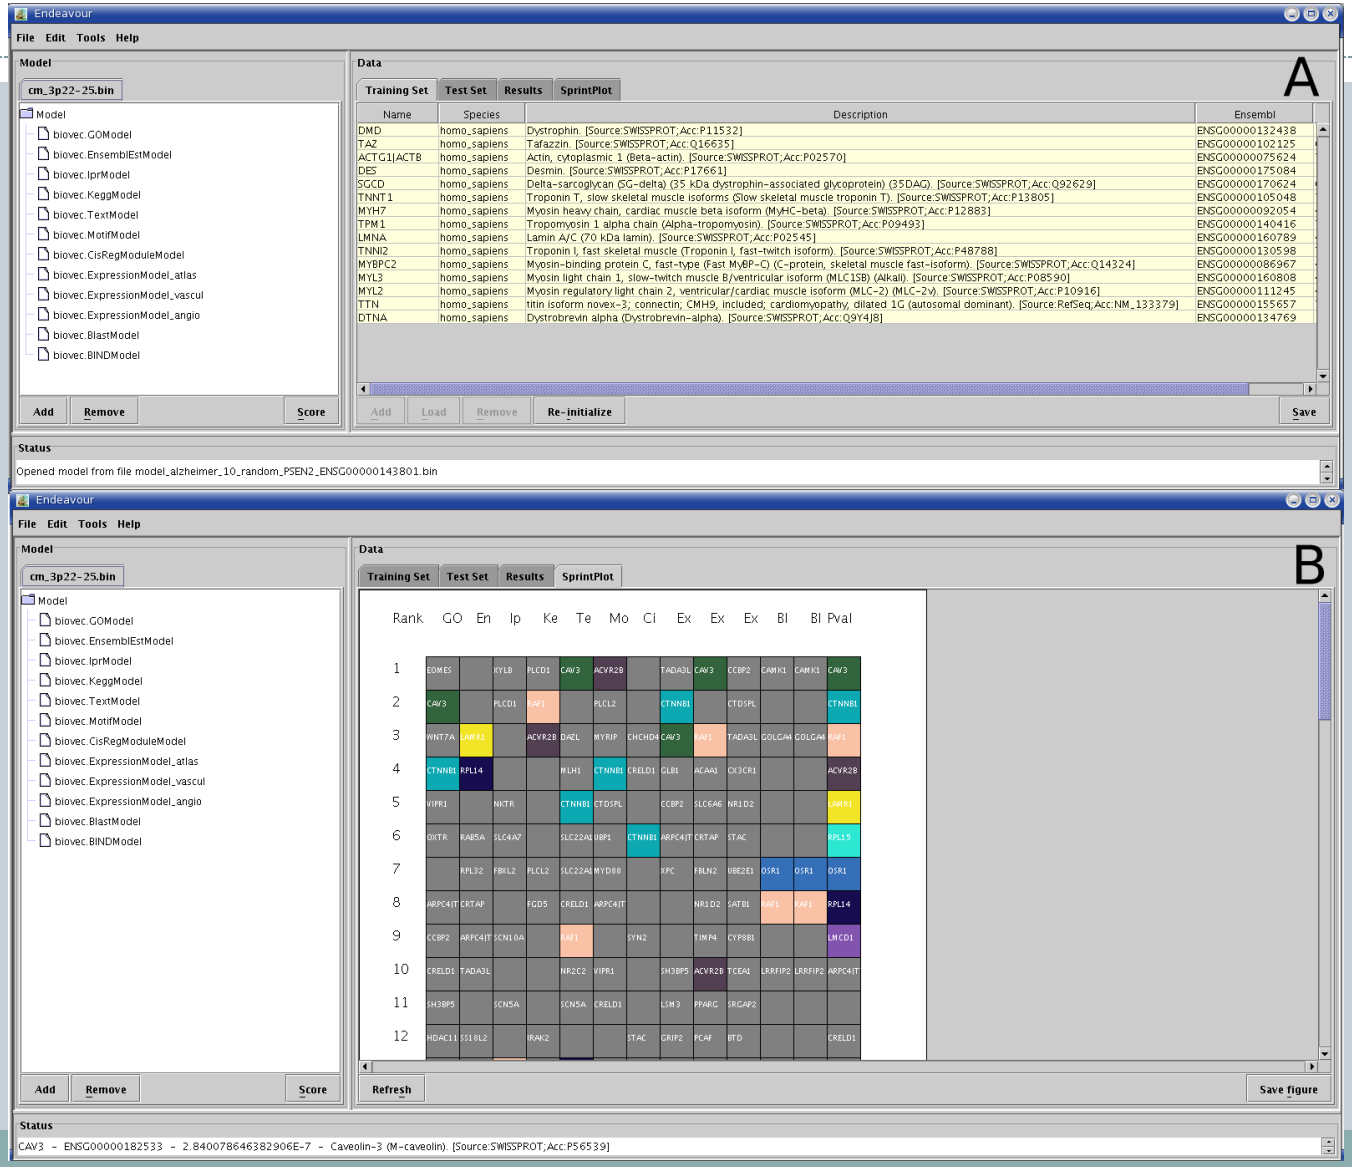
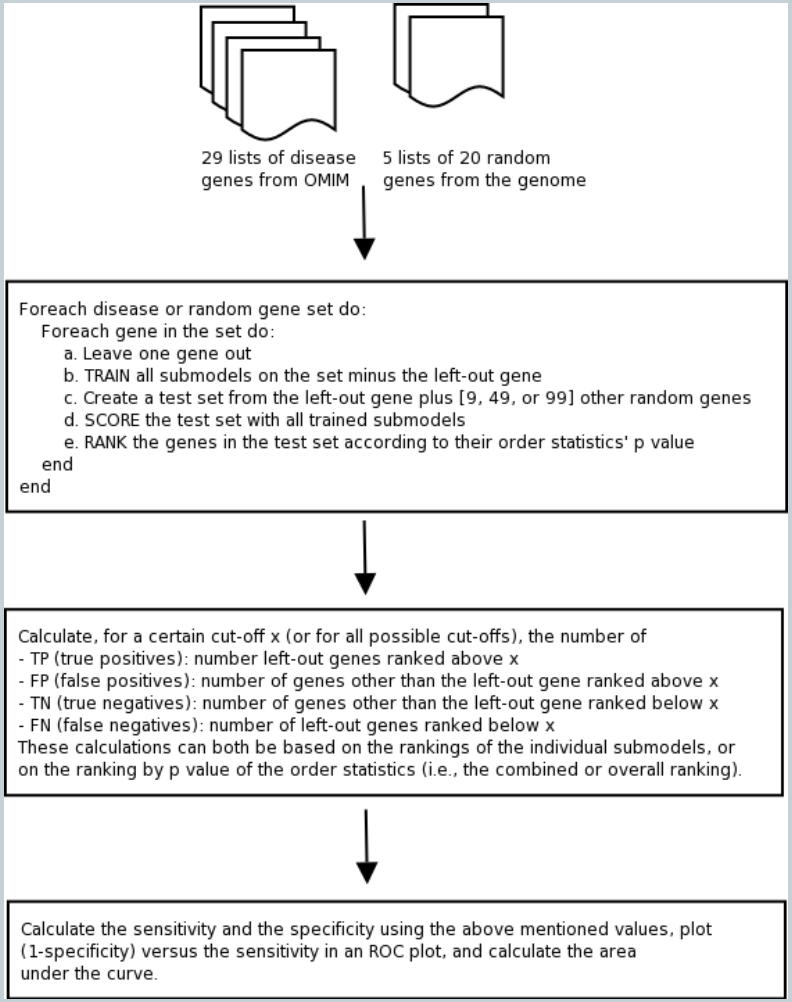
Pathology / …

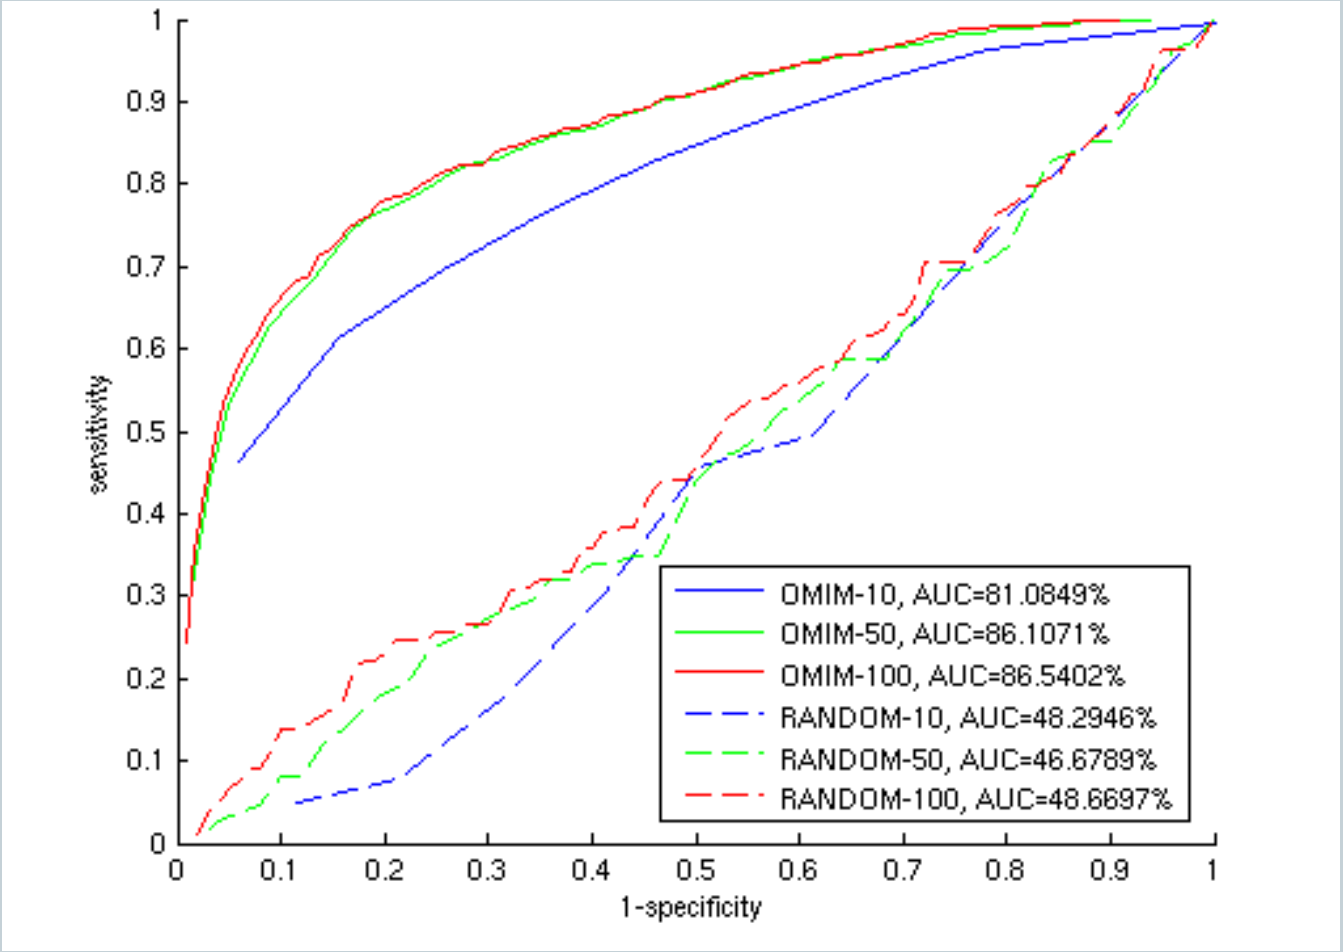
Application Screenshot



Validation Setup



Validation Results



Sensitivity - the proportion of true positives or the proportion of cases correctly identified by the test **as meeting** a certain condition (e.g. in mammography testing, the proportion of patients **with** cancer who test positive).

Specificity - the proportion of true negatives or the proportion of cases correctly identified by the test as **not meeting** a certain condition (e.g. in mammography testing, the proportion of patients **without** cancer who test negative).

Challenge

Manage all Array-CGH related information, from raw data over called aberrations to patient record.

Support routine clinical diagnostics workflow (2000 ppa) from array scan to final report, as well as ongoing biomedical research projects.

A web based application to store, manage, search, mine, analyze, report and visualize Array CGH-related data.
A joint effort of the Bio-informatics group and the Constitutional Cytogenetics group at the Center for Human Genetics of the University Hospital.

My Reports

Add all 30 cases to the selection

Regions waived from exclusion

The following regions are waived from exclusion and will never be filtered out

Challenge

Describe patient phenotypes in a consistent way, ensuring easy case report retrieval (search).

Enable data mining for detection of similar patients, and clusters of patients with similar phenotypes as putative novel syndromes.

Use standard phenotype definitions (ontologies)

- Barraitser & Winter LNDB (human dysmorphy)
- AEPC codes (heart specific phenotypes)
- POSSUM codes (malformations & syndromes)

Extensible: allow any vocabulary to be plugged in (UMLS, ICD10, …)

Structured phenotype description

Add / Remove

Code	Label	Description	Association
LNDB.32.16.02	Truncal ataxia / non-cerebellar ataxia	Some ataxias in the literature are not typically cerebellar, but use this alone with caution. Rather combine with cerebellar tremor if uncertain.	positive
AEPC.14.03.33	Microcephaly	Microcephaly	positive
LNDB.32.04.00	MENTAL,COGNITIVE FUNCTION, general abnormalities	no detailed description for [MENTAL,COGNITIVE FUNCTION, general abnormalities]	positive
LNDB.01.03.02	Low birthweight (< 3rd centile)	Below the 3rd centile for gestational age.	positive
LNDB.32.06.00	SEIZURES, general abnormalities	no detailed description for [SEIZURES, general abnormalities]	positive
LNDB.32.08.00	CRANIUM, general abnormalities	no detailed description for [CRANIUM, general abnormalities]	positive
LNDB.32.04.05	Hypotonia (non-myopathic)	Floppiness not due to muscle disease or peripheral nerve disease, but whose origin is central (mostly in the brain).	positive
LNDB.32.04.02	Mental retardation / developmental delay	Includes mental handicap, learning disabled, but not dementia. It is not progressive and the delay should be present from birth.	positive
LNDB.32.08.05	Microcephaly	A reduction in head circumference of greater than 2SD below the mean. Parental measurements must be taken into account.	positive
POSSUM.186	Microcephaly		positive
LNDB.15.01.02	Goitre	Enlarged thyroid gland. See under 'endocrine - thyroid' if associated with hyper or hypothyroidism. Use together.	positive
LNDB.02.00.00	STATURE	no detailed description for [STATURE]	positive

LNDB.11.04.02	Midline cleft upper lip	Often a small V-shaped indentation in the mid-line.	No evidence found
LNDB.32.04.05	Hypotonia (non-myopathic)	Floppiness not due to muscle disease or peripheral nerve disease, but whose origin is central (mostly in the brain).	**1 abstracts**
LNDB.32.08.05	Microcephaly	A reduction in head circumference of greater than 2SD below the mean. Parental measurements must be taken into account.	**2 abstracts**
LNDB.32.08.00	CRANIUM, general abnormalities	no detailed description for [CRANIUM, general abnormalities]	**2 abstracts**
LNDB.11.04.03	Prominent upper lip	A projecting upper lip. Use with thick (see below) if necessary.	No evidence found

39.60	**LETM1**	protein_coding	4 (-1):1784558-1827772	**604407**	LETM1 and EF-hand domain-containing protein 1, mitochondrial Precursor (Leucine zipper-EF-hand-containing transmembrane protein 1) [Source:UniProtKB/Swiss-Prot;Acc:O95202]	**9 abstracts**
36.35	**WHSC1**	protein_coding	4 (1):1842921-1953732	**602952**	Probable histone-lysine N-methyltransferase NSD2 (EC 2.1.1.43)(Nuclear SET domain-containing protein 2)(Wolf-Hirschhorn syndrome candidate 1 protein)(Multiple myeloma SET domain-containing protein)(Protein trithorax-5) [Source:UniProtKB/Swiss-Prot;Acc:O96028]	**11 abstracts**
14.22	**IDUA**	protein_coding	4 (1):970785-988316	**252800**	Alpha-L-iduronidase Precursor (EC 3.2.1.76) [Source:UniProtKB/Swiss-Prot;Acc:P35475]	**5 abstracts**

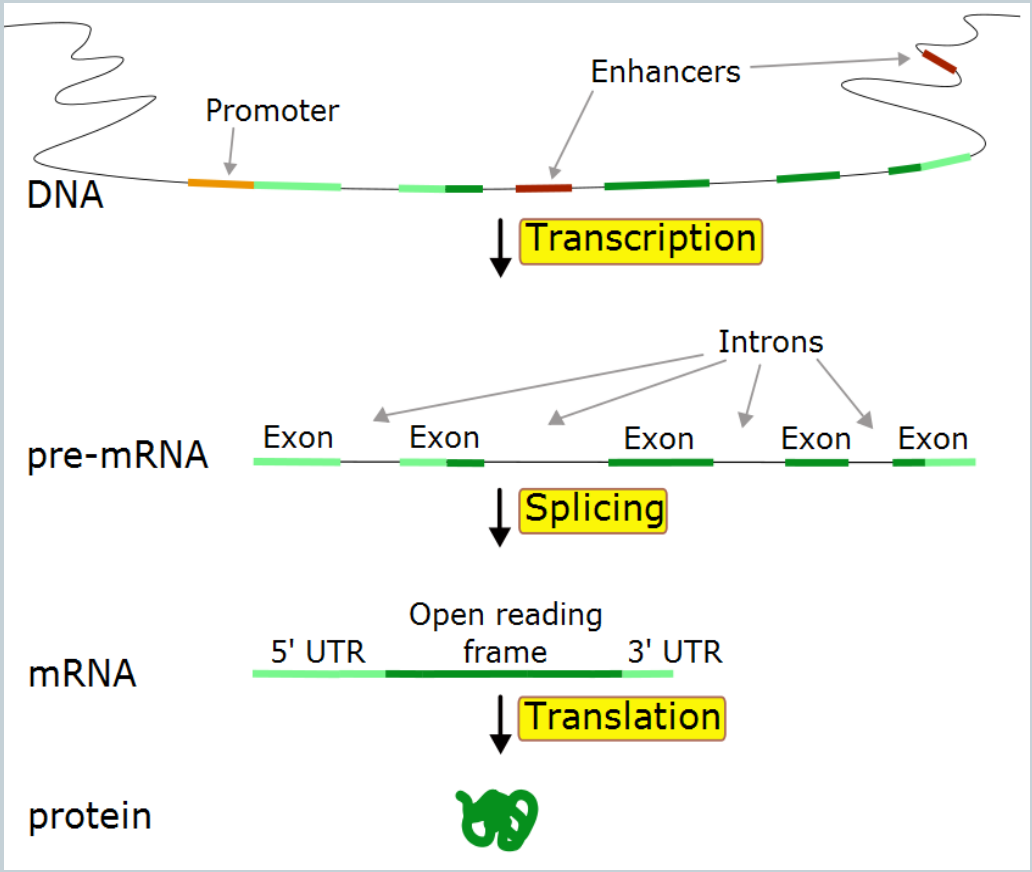
184.23	**ZEB2**	protein_coding	2 (-1):144862055-144994386	**605802**	Zinc finger E-box-binding homeobox 2 (Zinc finger homeobox protein 1b)(Smad-interacting protein 1)(SMADIP1) [Source:UniProtKB/Swiss-Prot;Acc:O60315]	**56 abstracts**
183.67	**MCPH1**	protein_coding	8 (1):6251529-6493434	**607117**	Microcephalin [Source:UniProtKB/Swiss-Prot;Acc:Q8NEM0]	**56 abstracts**
182.66	**CDK5R1**	protein_coding	17 (1):27838214-27842383	**603460**	Cyclin-dependent kinase 5 activator 1 Precursor (CDK5 activator 1)(Cyclin-dependent kinase 5 regulatory subunit 1)(Tau protein kinase II 23 kDa subunit)(p23)(TPKII regulatory subunit) [Contains Cyclin-dependent kinase 5 activator 1, p35(p35);Cyclin-dependent kinase 5 activator 1, p25(p25)] [Source:UniProtKB/Swiss-Prot;Acc:Q15078]	**144 abstracts**

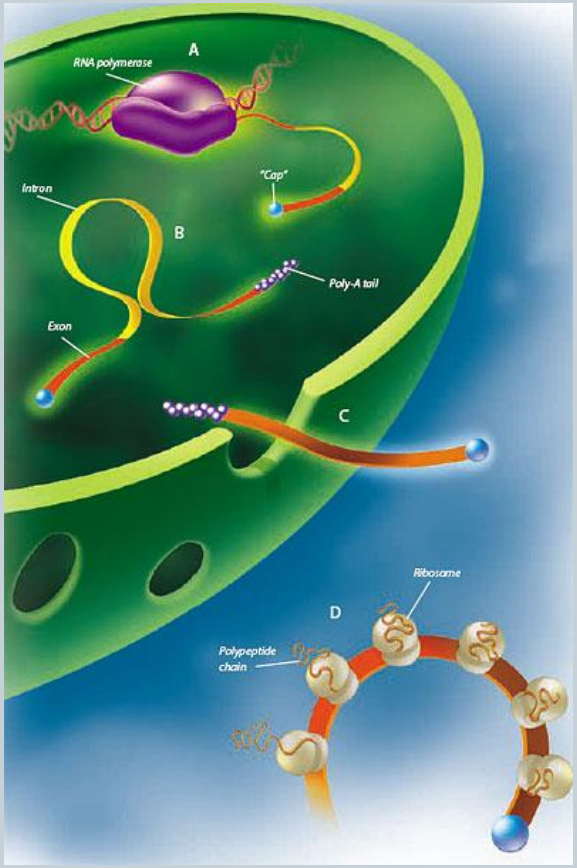
Chapter 5 – genome annotation

DISTRIBUTED ANNOTATION AND *CIS*-REGULATORY ELEMENTS: USING INFORMATION FROM LITERATURE

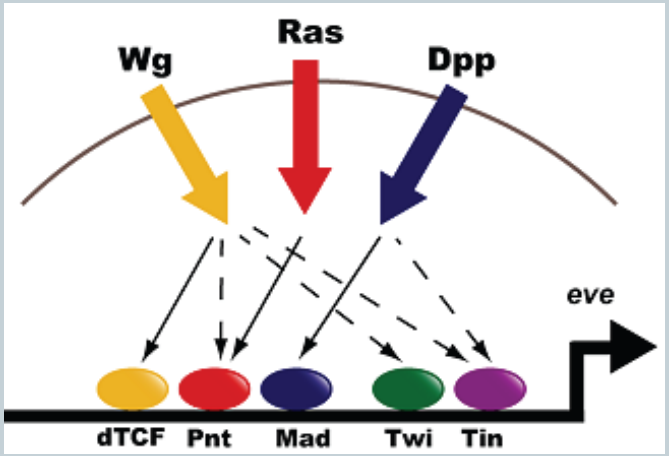
Regulatory elements

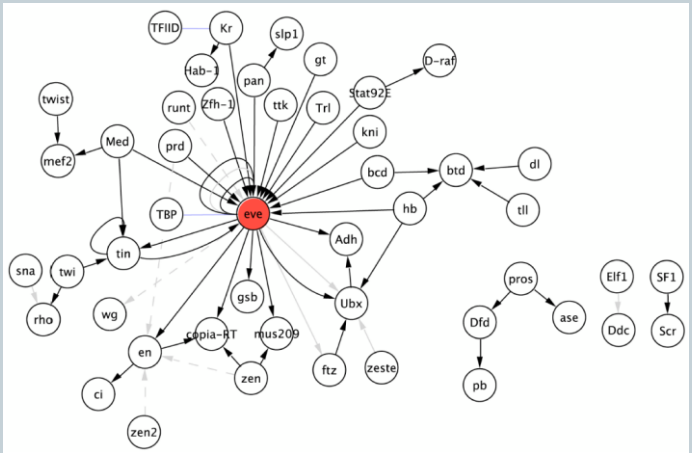
- Transcription regulation: gene activity switches





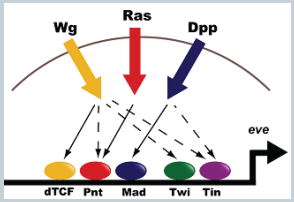
cis-regulatory elements

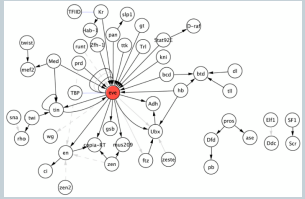




- Vast amount of discovered regulatory data remains locked in biomedical literature
- *Ad hoc* efforts: small teams curate organism- or process-specific datasets from the primary literature for short-term research purposes

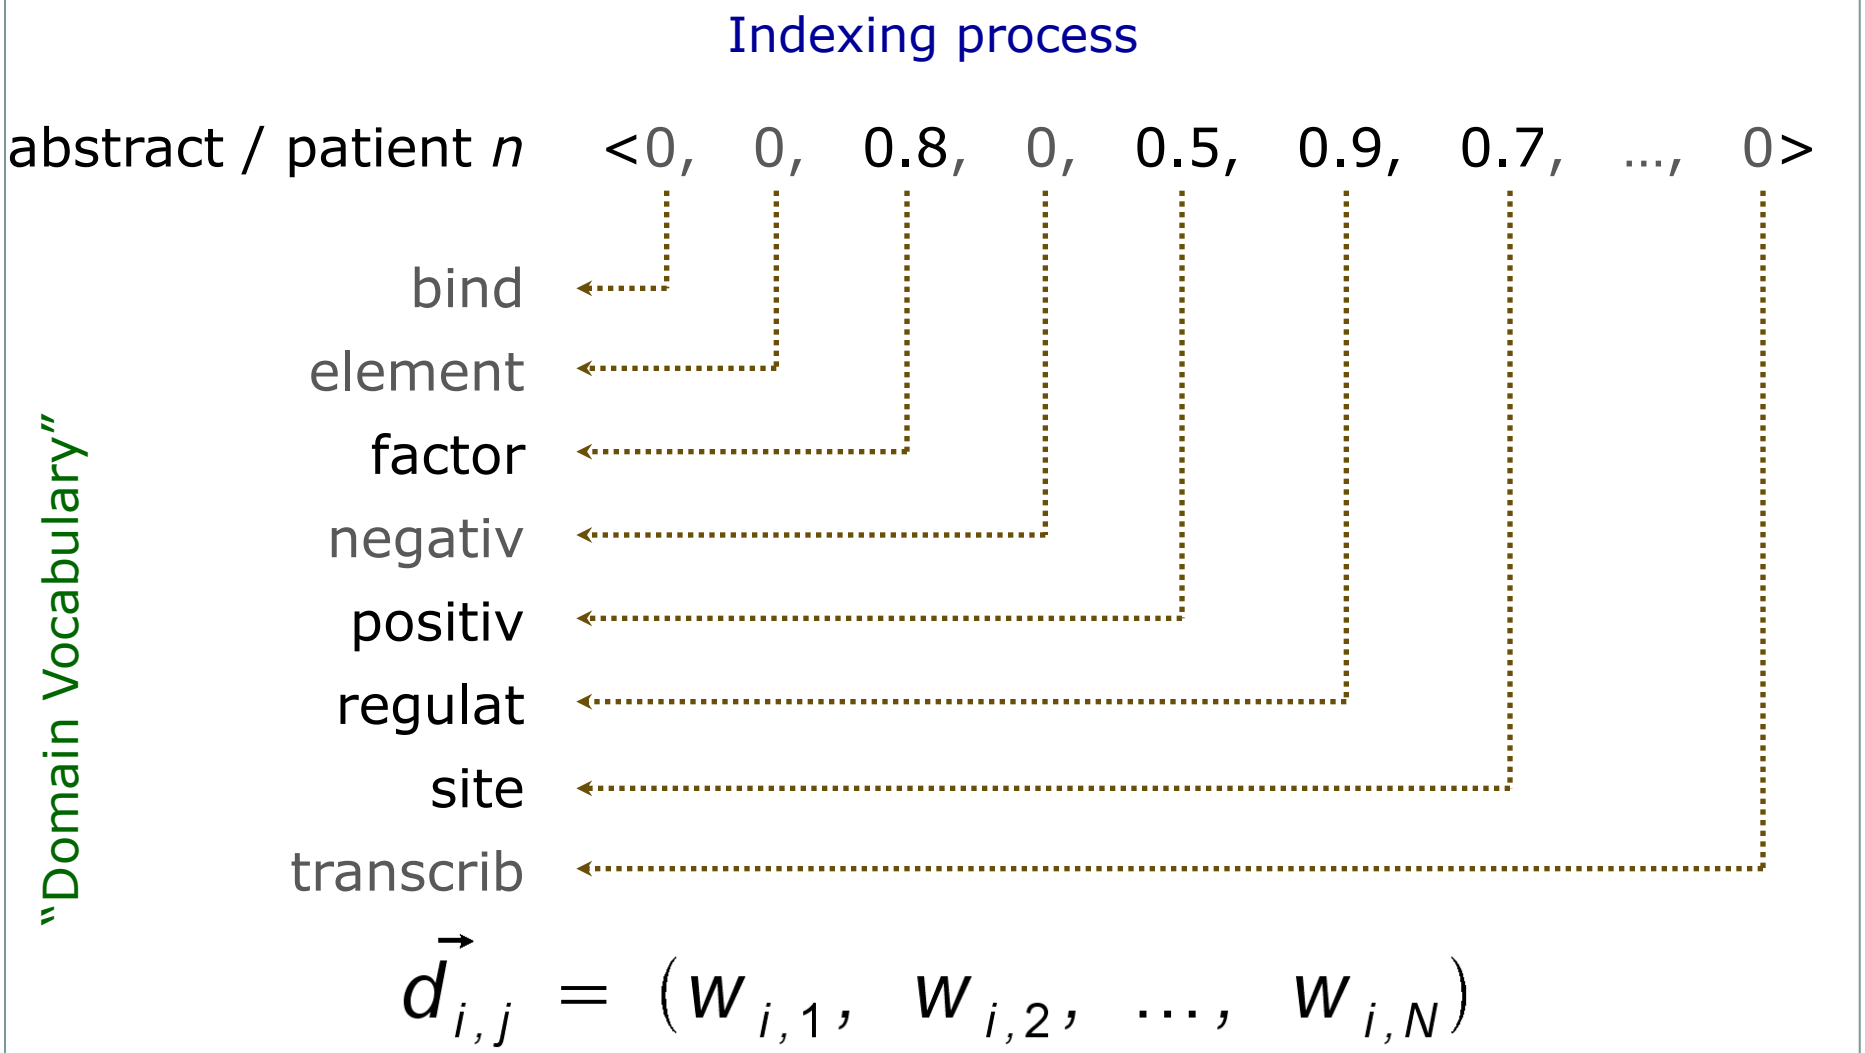
cis-regulatory elements





- ORegAnno and PAZAR
  - Manually curated database of regulatory elements
  - community annotation of regulatory data
- Population of curation pipeline by text-mining queue
  - text-mining to retrieve and extract relevant documents

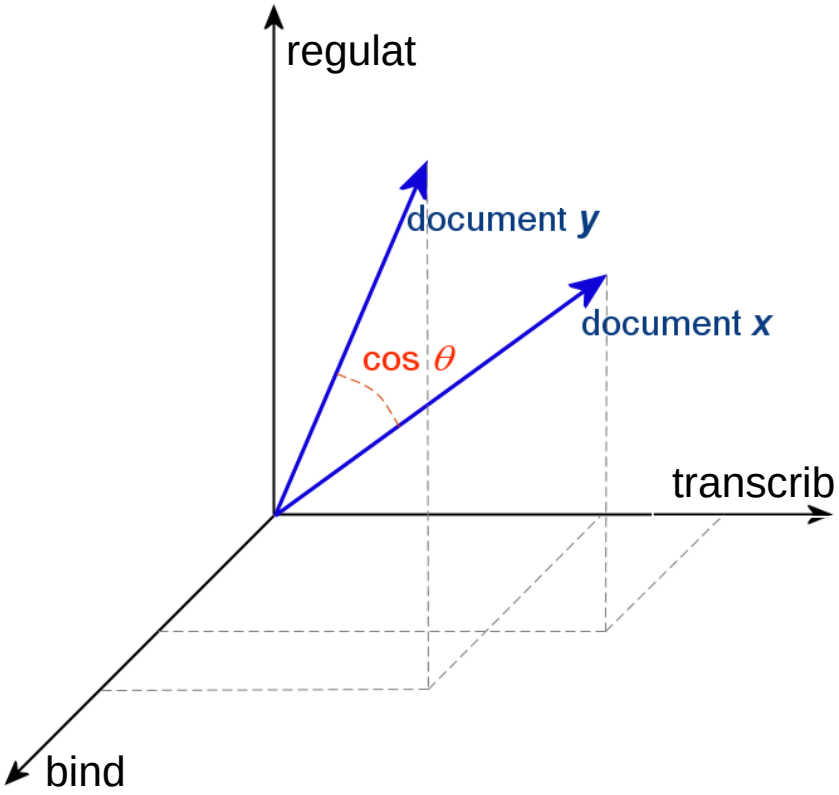
Vector Space Model



$$\vec{d}_{i,j} = (w_{i,1}, w_{i,2}, \ldots, w_{i,N})$$

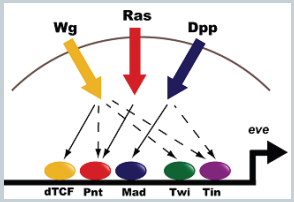
Vector Space Model: Similarity

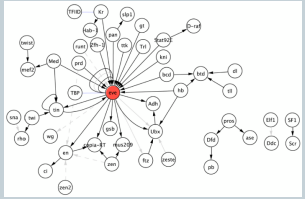
Ranking and scoring documents



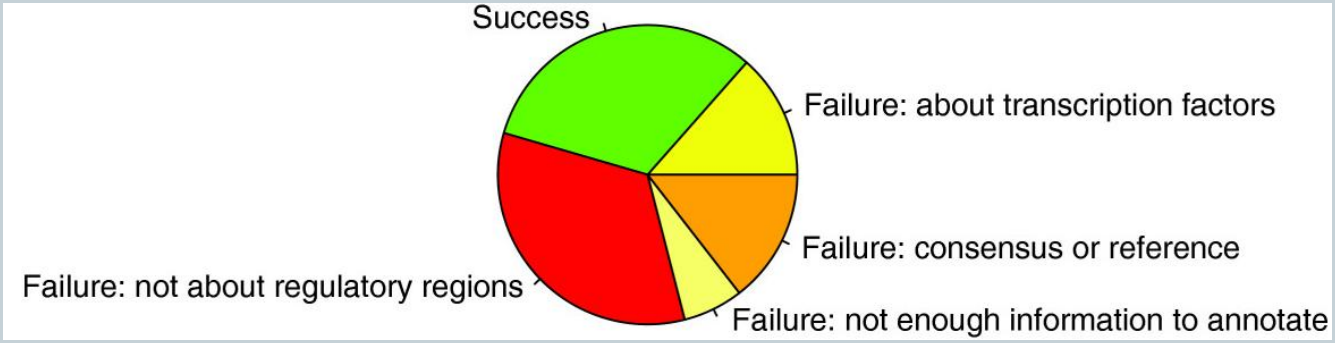
$$sim_{vs}(q, x_i) = Q \cdot X_i = \frac{\sum_{j=1}^{m} v_j \cdot w_{ij}}{\sqrt{\sum_{j=1}^{m} (v_j)^2 \cdot \sum_{j=1}^{m} (w_{ij})^2}}$$

Cis-regulatory elements





- ORegAnno and PAZAR
  - Manually curated database of regulatory elements
  - community annotation of regulatory data
- Population of curation pipeline by text-mining queue
  - text-mining to retrieve and extract relevant documents



Publications

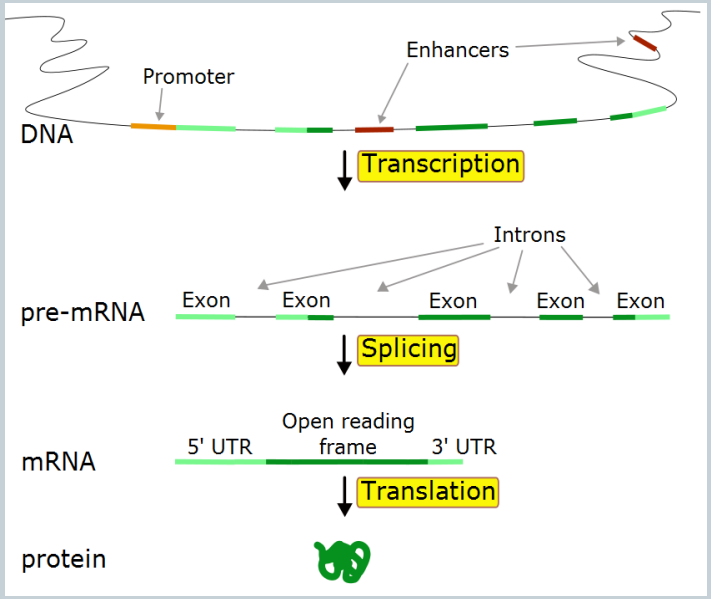
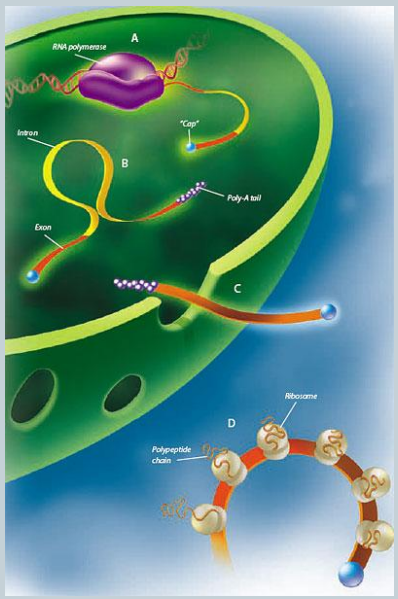
Chapter 6 – data fusion on biomedical text and gene expression arrays

TEXT DATA AS VALIDATION OF GENE CLUSTERS AND AS PRIOR FOR BAYESIAN NETWORKS

Chapter 6 – data fusion on biomedical text and gene expression arrays

- Background

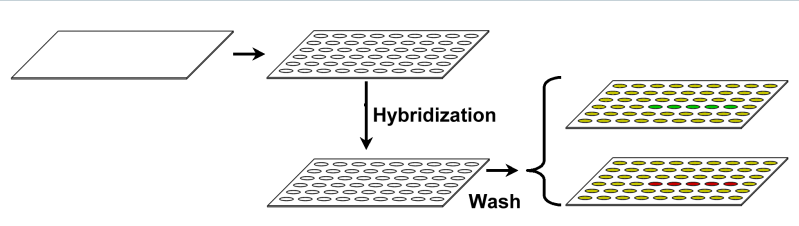


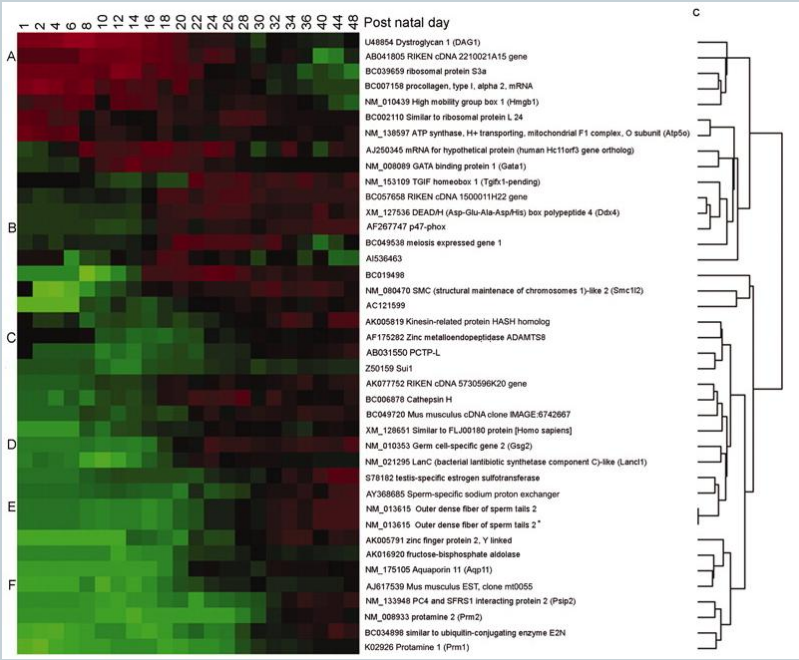


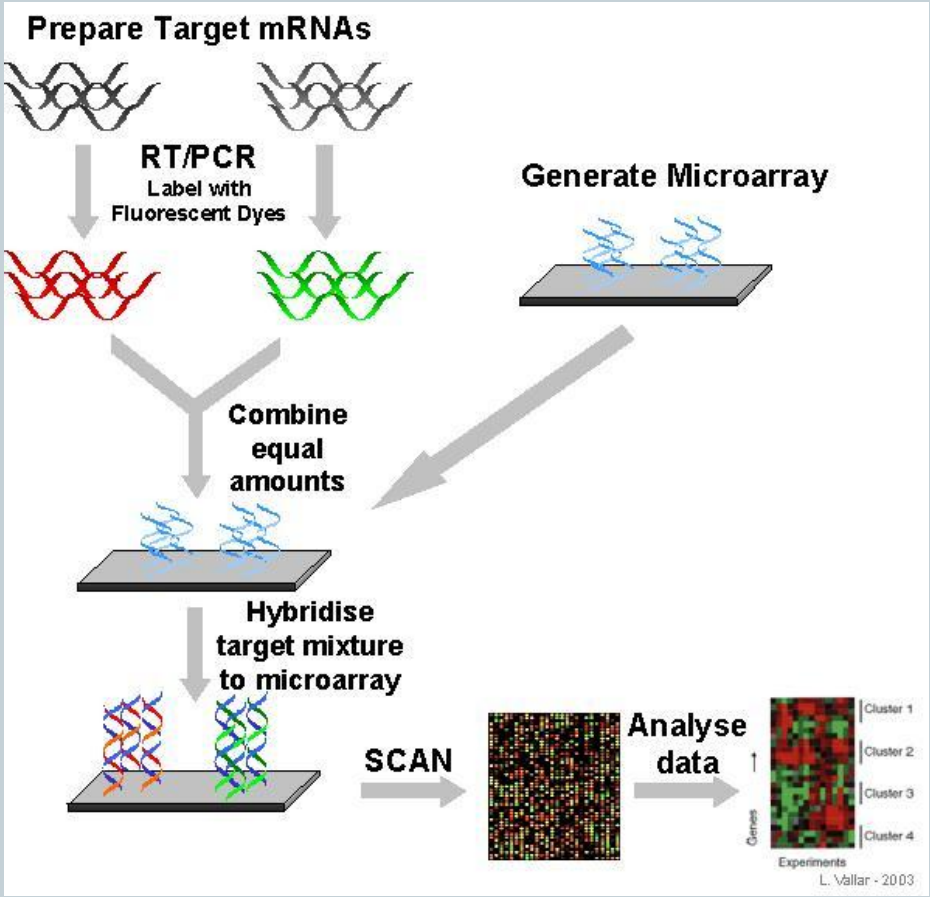
Smith *et al* - Noggin: important factor in brain and nerve development

Chapter 6 – data fusion on biomedical text and gene expression arrays

- Background







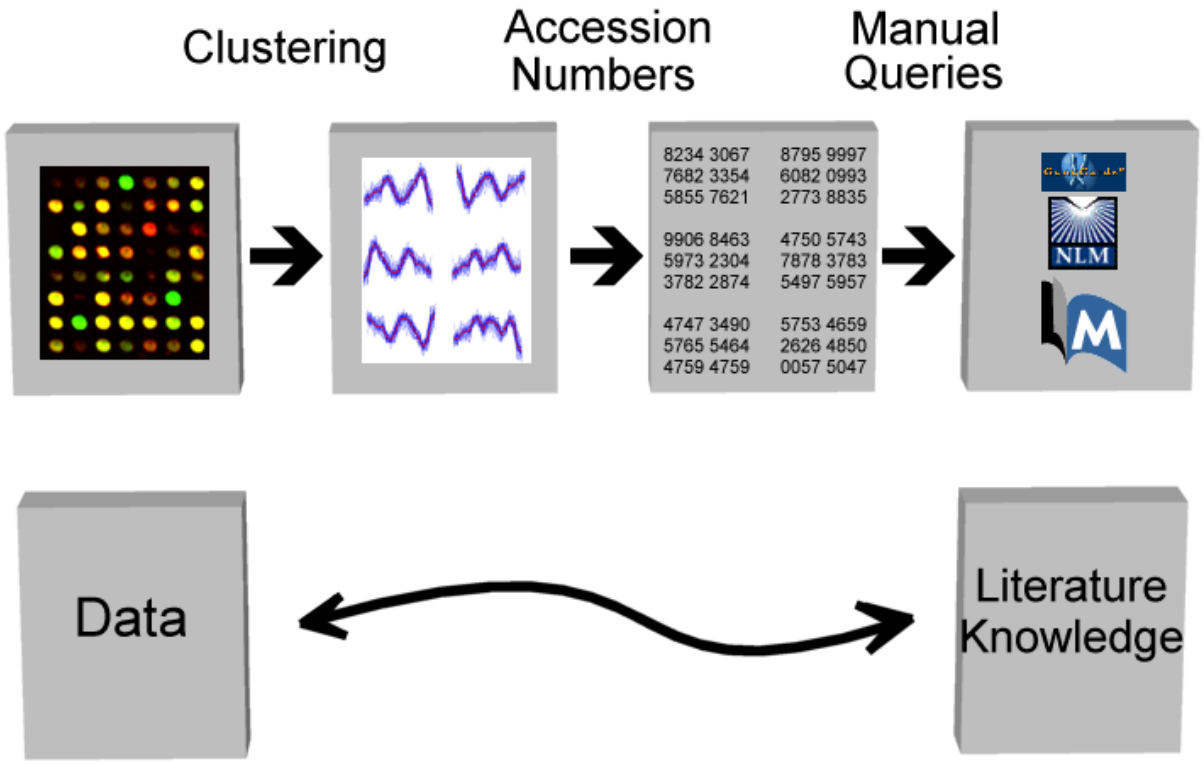
Chapter 6 – data fusion on biomedical text and gene expression arrays

- Application: expression arrays
  - Co-expressed genes: cluster validation
    - TXTGate overview
    - Validation
- Application: text data as Bayesian network prior
  - Context
  - results

Chapter 6 – data fusion on biomedical text and gene expression arrays

- Application: expression arrays
  - Co-expressed genes: cluster validation
    - **TXTGate overview**
    - **Validation**
- Application: text data as Bayesian network prior
  - Context
  - results

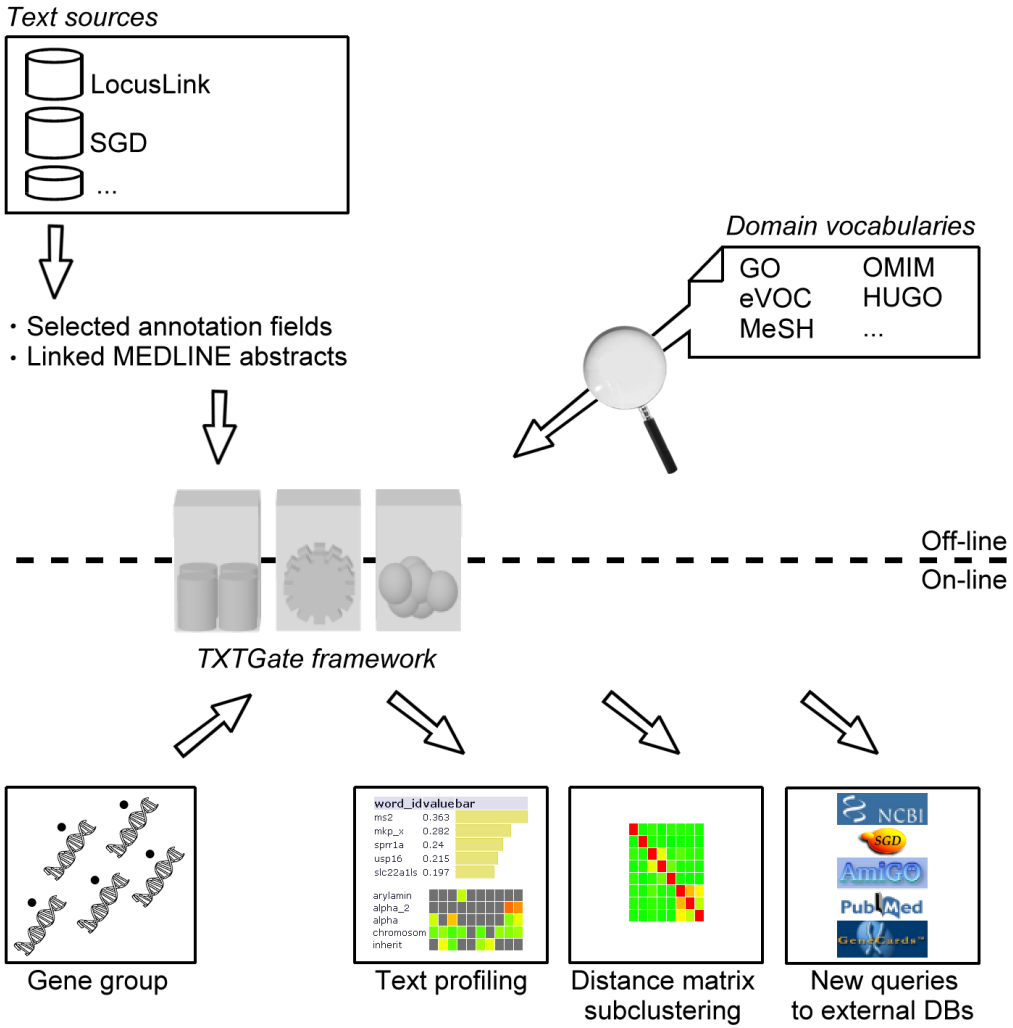
What is TXTGate?



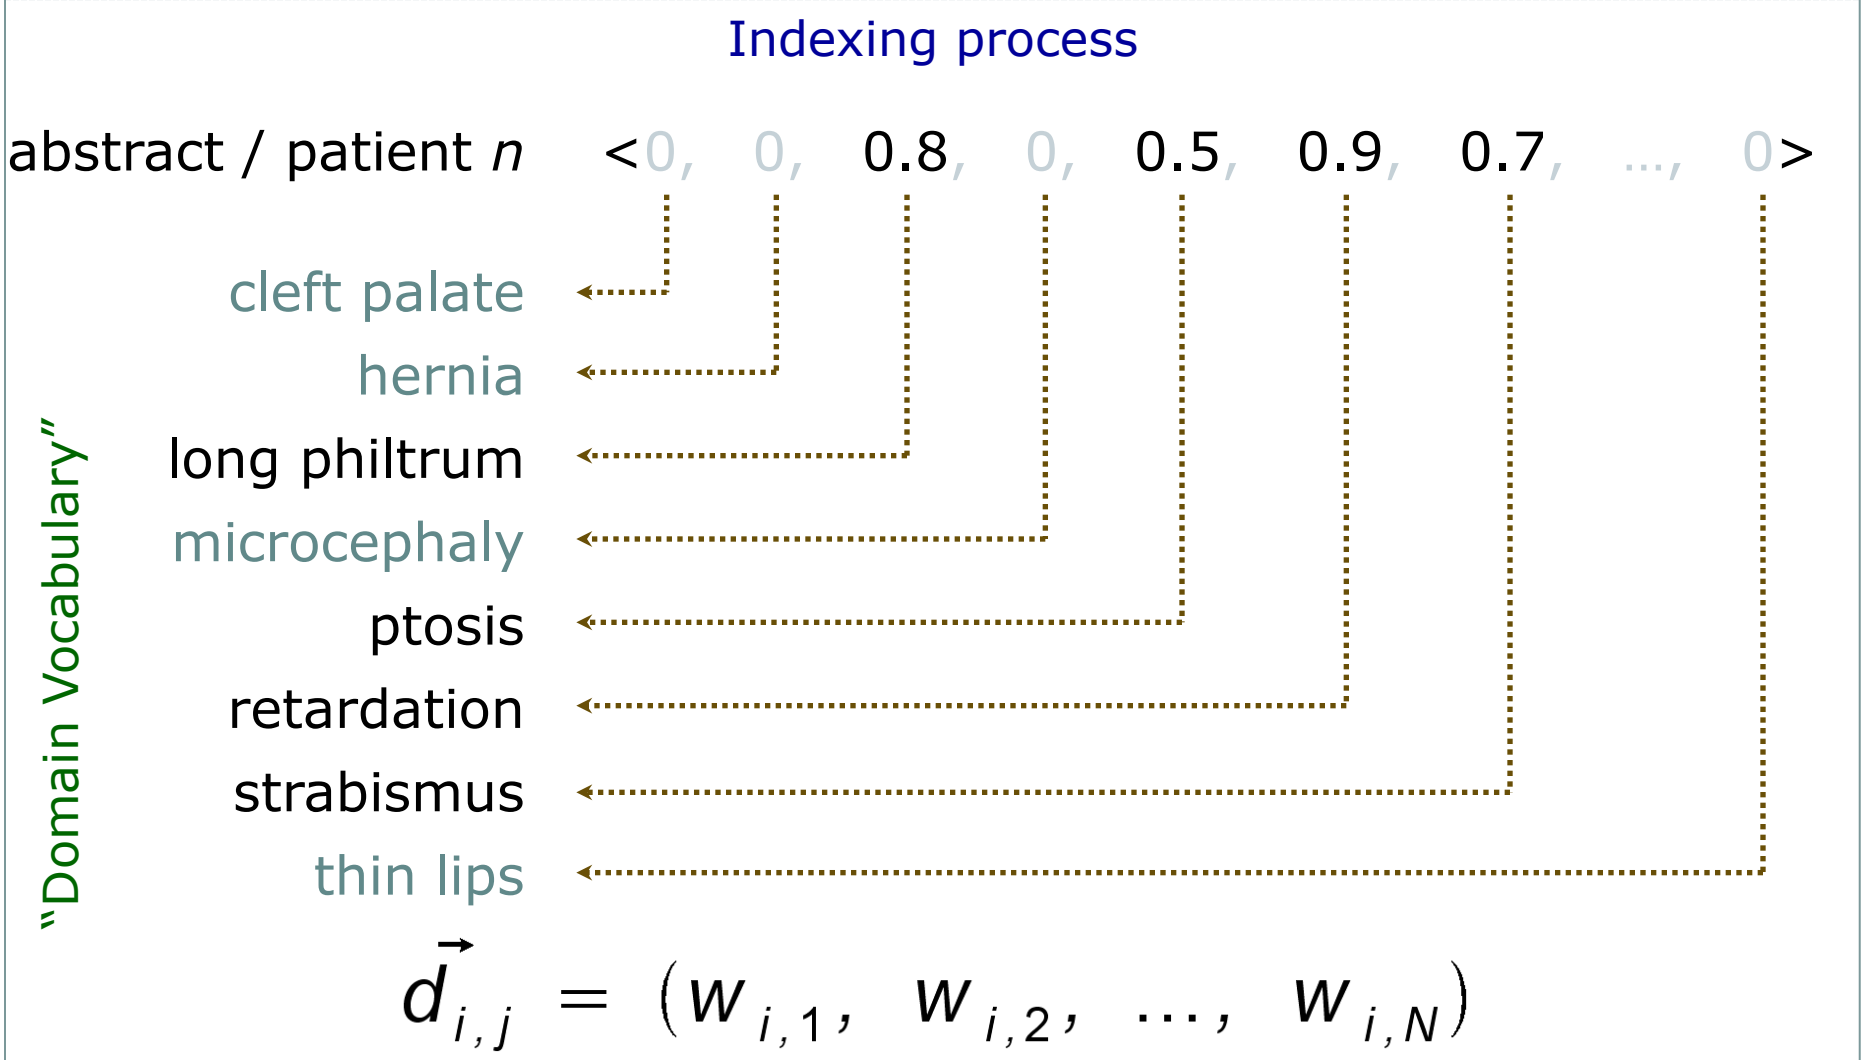
TXTGate:

Gene Cluster Analysis and Profiling Tool

Functional Overview



Vector Space Model



$$\vec{d}_{i,j} = (w_{i,1}, w_{i,2}, \ldots, w_{i,N})$$

Creating an index: details

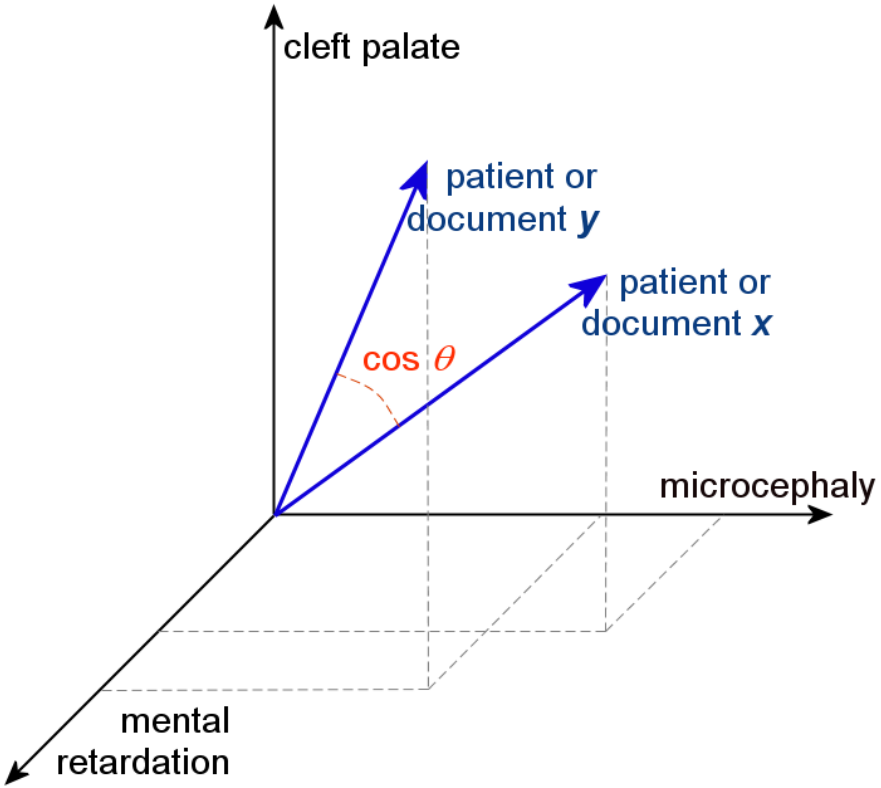
Creating an index involves:

- Stemming
  - treat “methylate”, “methylated”, “methylation” as one
- Remove stop words
  - “the”, “for”, “is” are not significant
- Construct phrases
  - “nucleic” and “acid” should be read as “nucleic_acid”
- Detect synonyms
  - “p53”, “tp53” should be treated as being identical
- Choose Weighting Scheme

$$tf_{i,j} = \frac{f_{i,j}}{\max_j f_{i,j}} \qquad idf_t = \log\left(1 + \frac{D}{D_t}\right) \qquad tf_{d,t} \times idf_{d,t}$$

Similarity

Ranking, scoring and clustering of patients or documents



$$sim_{vs}(q, x_i) = Q \cdot X_i = \frac{\sum_{j=1}^{m} v_j \cdot w_{ij}}{\sqrt{\sum_{j=1}^{m} (v_j)^2 \cdot \sum_{j=1}^{m} (w_{ij})^2}}$$

Profiling and Clustering

Chapter 7 – Conclusions and perspectives

ACCOMPLISHMENTS AND FUTURE PROSPECTS

Chapter 7 – Conclusions and perspectives

- Accomplishments
  - Increase Array CGH data interpretability by putting it in context
    - Data representation
    - Algorithms and statistics
    - Information (literature, other patients, public data sources, …)
  - Built a framework for data integration and mining
    - Biomedical text
    - Microarray assay data
    - Structured phenotype annotations
  - Built and extended platforms for
    - patient data aggregation and management
    - tools for clinical and functional interpretation
- Challenges
  - Future proof platforms - the data avalanche: next generation sequencing
  - Global initiatives to chart genome variation (CHERISH, national consortia, …)
  - Prepare for a clinical (r)evolution
    - Data collection and distribution will spread (from referrer to patient, eHealth)
    - Merger of different disciplines (SNP genotyping, expression, copy number variation, epigenetic assays, single gene polymorphisms, population studies… and environment)
    - Applications in oncology
    - Personalized medicine (early screening, targeted treatment)
