Life goes live

Prof. Dr. Bart De Moor

KU Leuven, Belgium

What is science ? What are models ?
What is technology ? What is engineering ?

The seven spheres of engineering

1. **Matter**
2. **Energy**
3. **Information**
4. **Sustainability**
5. **Social**
6. **Culture**
7. **Life**

Analysis and Design in the seven spheres

Utopia ? Design of living systems ?

What is science ?

- Describe and understand the world

- From myths/stories to verifiable facts

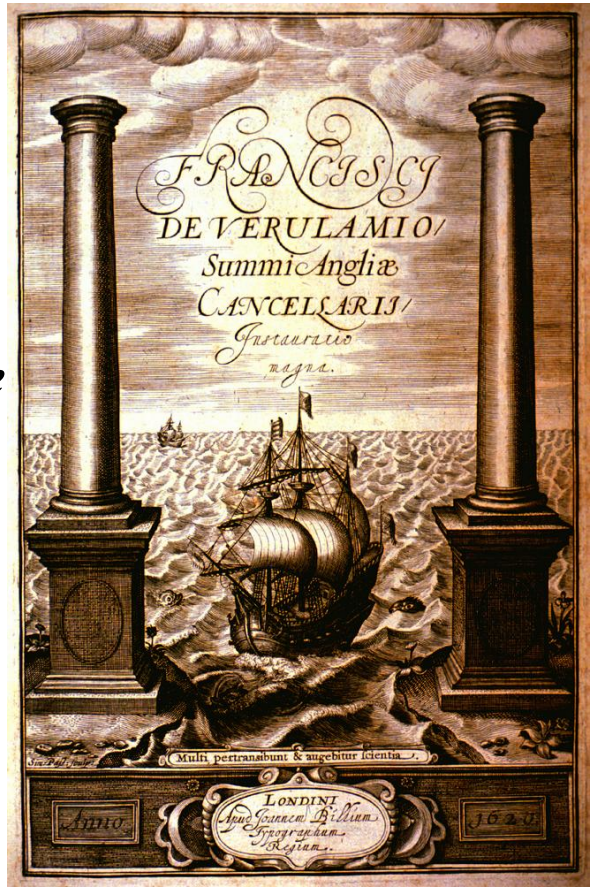
- Religion and science

  - The creator outside his creation
  - *Galilei and the church*
  - *Napoleon: Où est Dieu dans votre système ?*

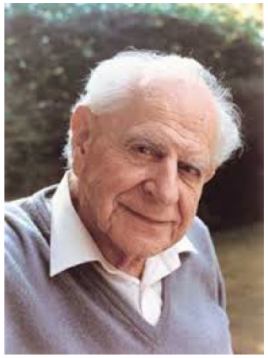
  Laplace: Dieu ? Je n'ai pas besoin de cette hypothèse

- Descartes: 'Je pense donc je suis' 'Cogito ergo sum'

- Francis Bacon (1561 – 1626)
  - -Experimental method
  - -Progress !
  - -Nec plus ultra; The limit is the sky !



What is science ?



- Popper's Demarcation-criterion

A statement or a theory is scientific when it clarifies and establishes its own weaknesses

'Irrefutability is not a virtue of a theory, but a vice'
Karl Popper

No scientific theory is true for ever; A theory is scientific when it shows where it can be attacked

A scientific theory predicts, but forbids more than it will allow

Not scientific:

- **Any religion or 'belief'**
- **Marxism, Liberalism, Socialism, ….**

What are models ?

William van Occam (1290-1349):
“Entia non sunt multiplicanda praeter necessitatem”

An simple argument with the same explanatory power as a more complicated one, is to be preferred.

What is technology ?

- Technology = techne logos
= the discipline on know how to do something

-Technology = transbiological evolution on top of the natural biological evolution

What is engineering ?

Engineering = use technology to *design* solutions to challenges and problems

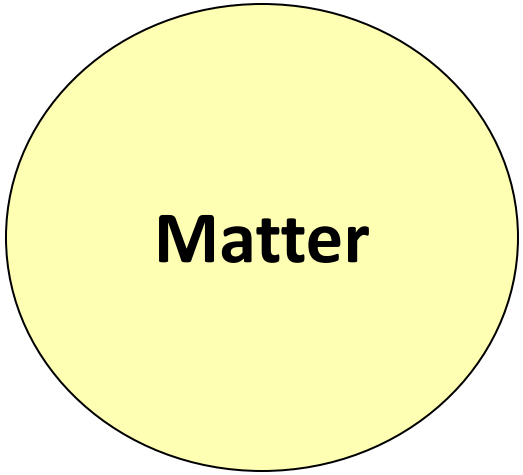
What is science ? What are models ?
What is technology ? What is engineering ?

The seven spheres of engineering

1. **Matter**
2. **Energy**
3. **Information**
4. **Sustainability**
5. **Social**
6. **Culture**
7. **Life**

Analysis and Design in the seven spheres

Utopia ? Design of living systems ?



Matter

The science (analysis)

Kepler

Law 1: Orbit = ellips; Sun = focus

Law 2: 'Radial line' colors equal surfaces in equal time intervals

Newton

Law 3: $$\frac{T_1^2}{T_2^2} = \frac{a_1^3}{a_2^3}$$

$$\mathbf{F} = m.\mathbf{a}$$

$$F = G\,\frac{m.M}{r^2}$$

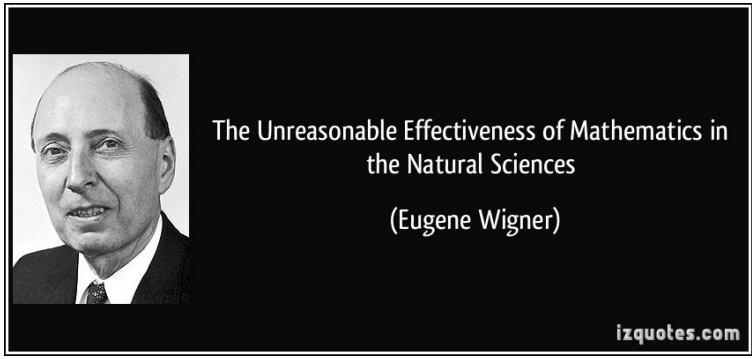
The Unreasonable Effectiveness of Mathematics in the Natural Sciences

Richard Courant Lecture in Mathematical Sciences delivered at New York University, May 11, 1959

EUGENE P. WIGNER
Princeton University

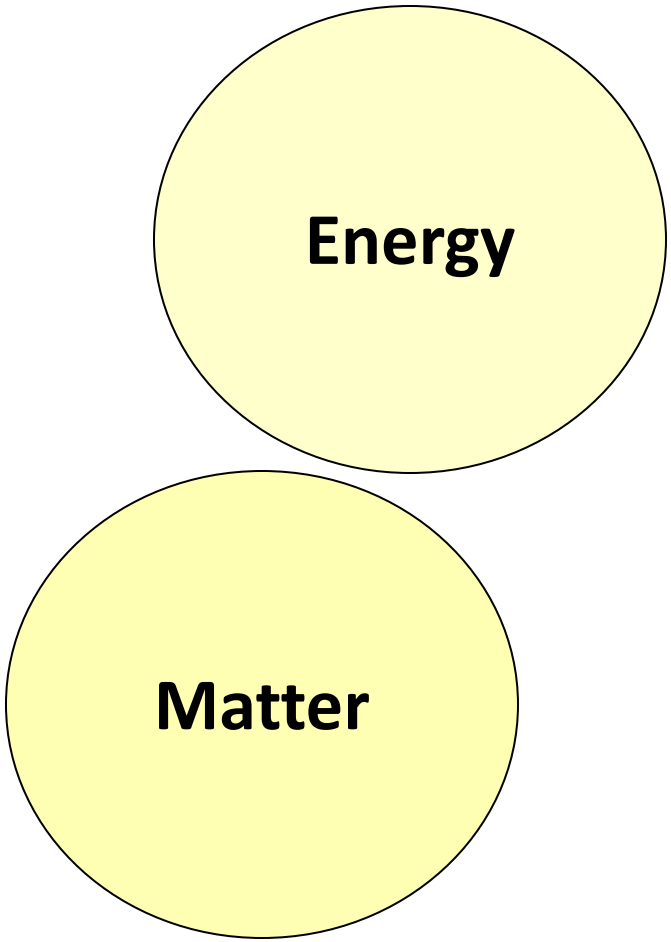
"and it is probable that there is some secret here which remains to be discovered." (*C. S. Peirce*)

There is a story about two friends, who were classmates in high school, talking about their jobs. One of them became a statistician and was working on population trends. He showed a reprint to his former classmate. The reprint started, as usual, with the Gaussian distribution and the statistician explained to his former classmate the meaning of the symbols for the actual population, for the average population, and so on. His classmate was a bit incredulous and was not quite sure whether the statistician was pulling his leg. "How can you know that?" was his query. "And what is this symbol here?" "Oh," said the statistician, "this is π." "What is that?" "The ratio of the circumference of the circle to its diameter." "Well, now you are pushing your joke too far," said the classmate, "surely the population has nothing to do with the circumference of the circle."



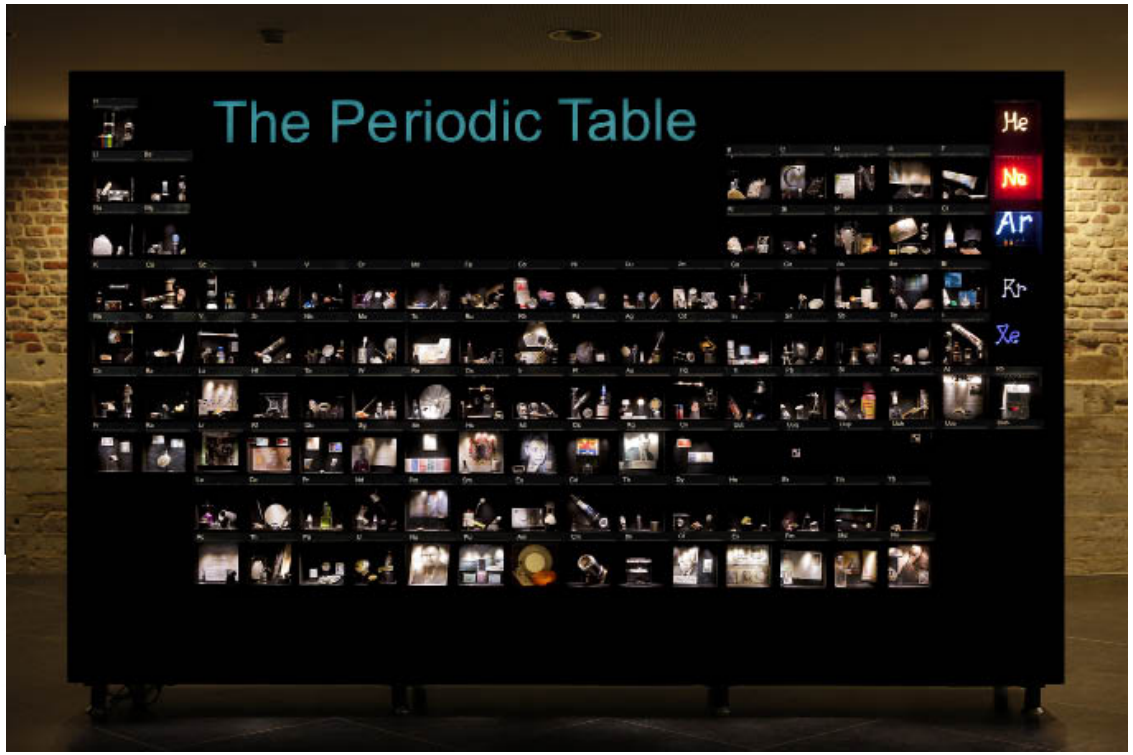
Technology and Engineering Design:
The first industrial revolution (1700…)

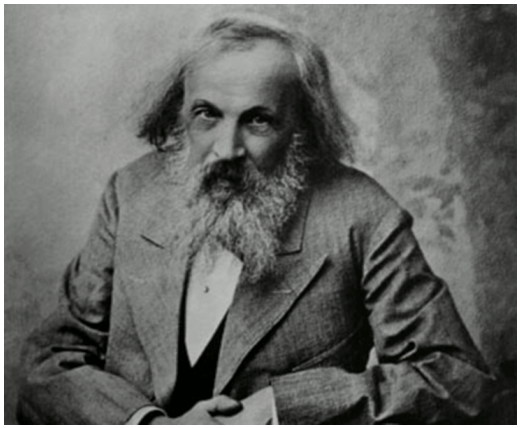
- **Steam engine (Watt)**
- **Mechanisation of textile industries**
- **Infrastructure for mobility: rail roads**
- **Water and Coal as energy source**
- ***Transition of a feudal rural towards industrial society***
- ***Socio-cultural evolution follows the economical-technical one (French revolution)***



Energy
Matter

The science (analysis)



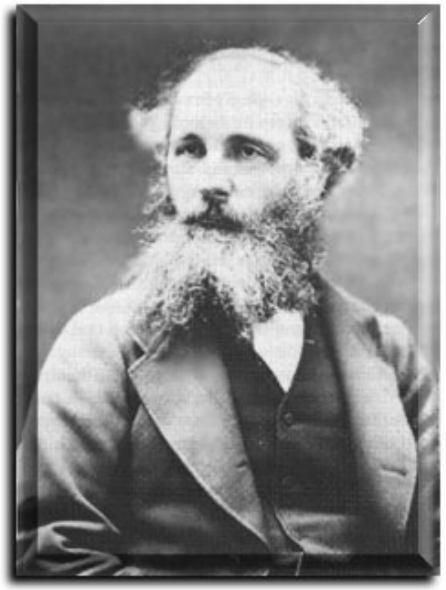


$$\nabla \cdot \mathbf{D} = \rho \qquad (1) \qquad \text{Gauss' Law}$$

$$\nabla \cdot \mathbf{B} = 0 \qquad (2) \qquad \text{Gauss' Law for magnetism}$$

$$\nabla \times \mathbf{E} = -\frac{\partial \mathbf{B}}{\partial t} \qquad (3) \qquad \text{Faraday's Law}$$

$$\nabla \times \mathbf{H} = \frac{\partial \mathbf{D}}{\partial t} + \mathbf{J} \qquad (4) \qquad \text{Ampère-Maxwell Law}$$



Technology & Engineering Design:
The second industrial revolution (1870…)

-Mass production and consumption

-Electricity and oil as energy sources

-Chemical industry develops

-Infrastructure for mobility: road networks

-Telecommunication develops, radio, TV

-*Labor and Capital (Marx) ; Unions ; Liberalism: Adam Smith*

-*Government as regulator and facilitator*

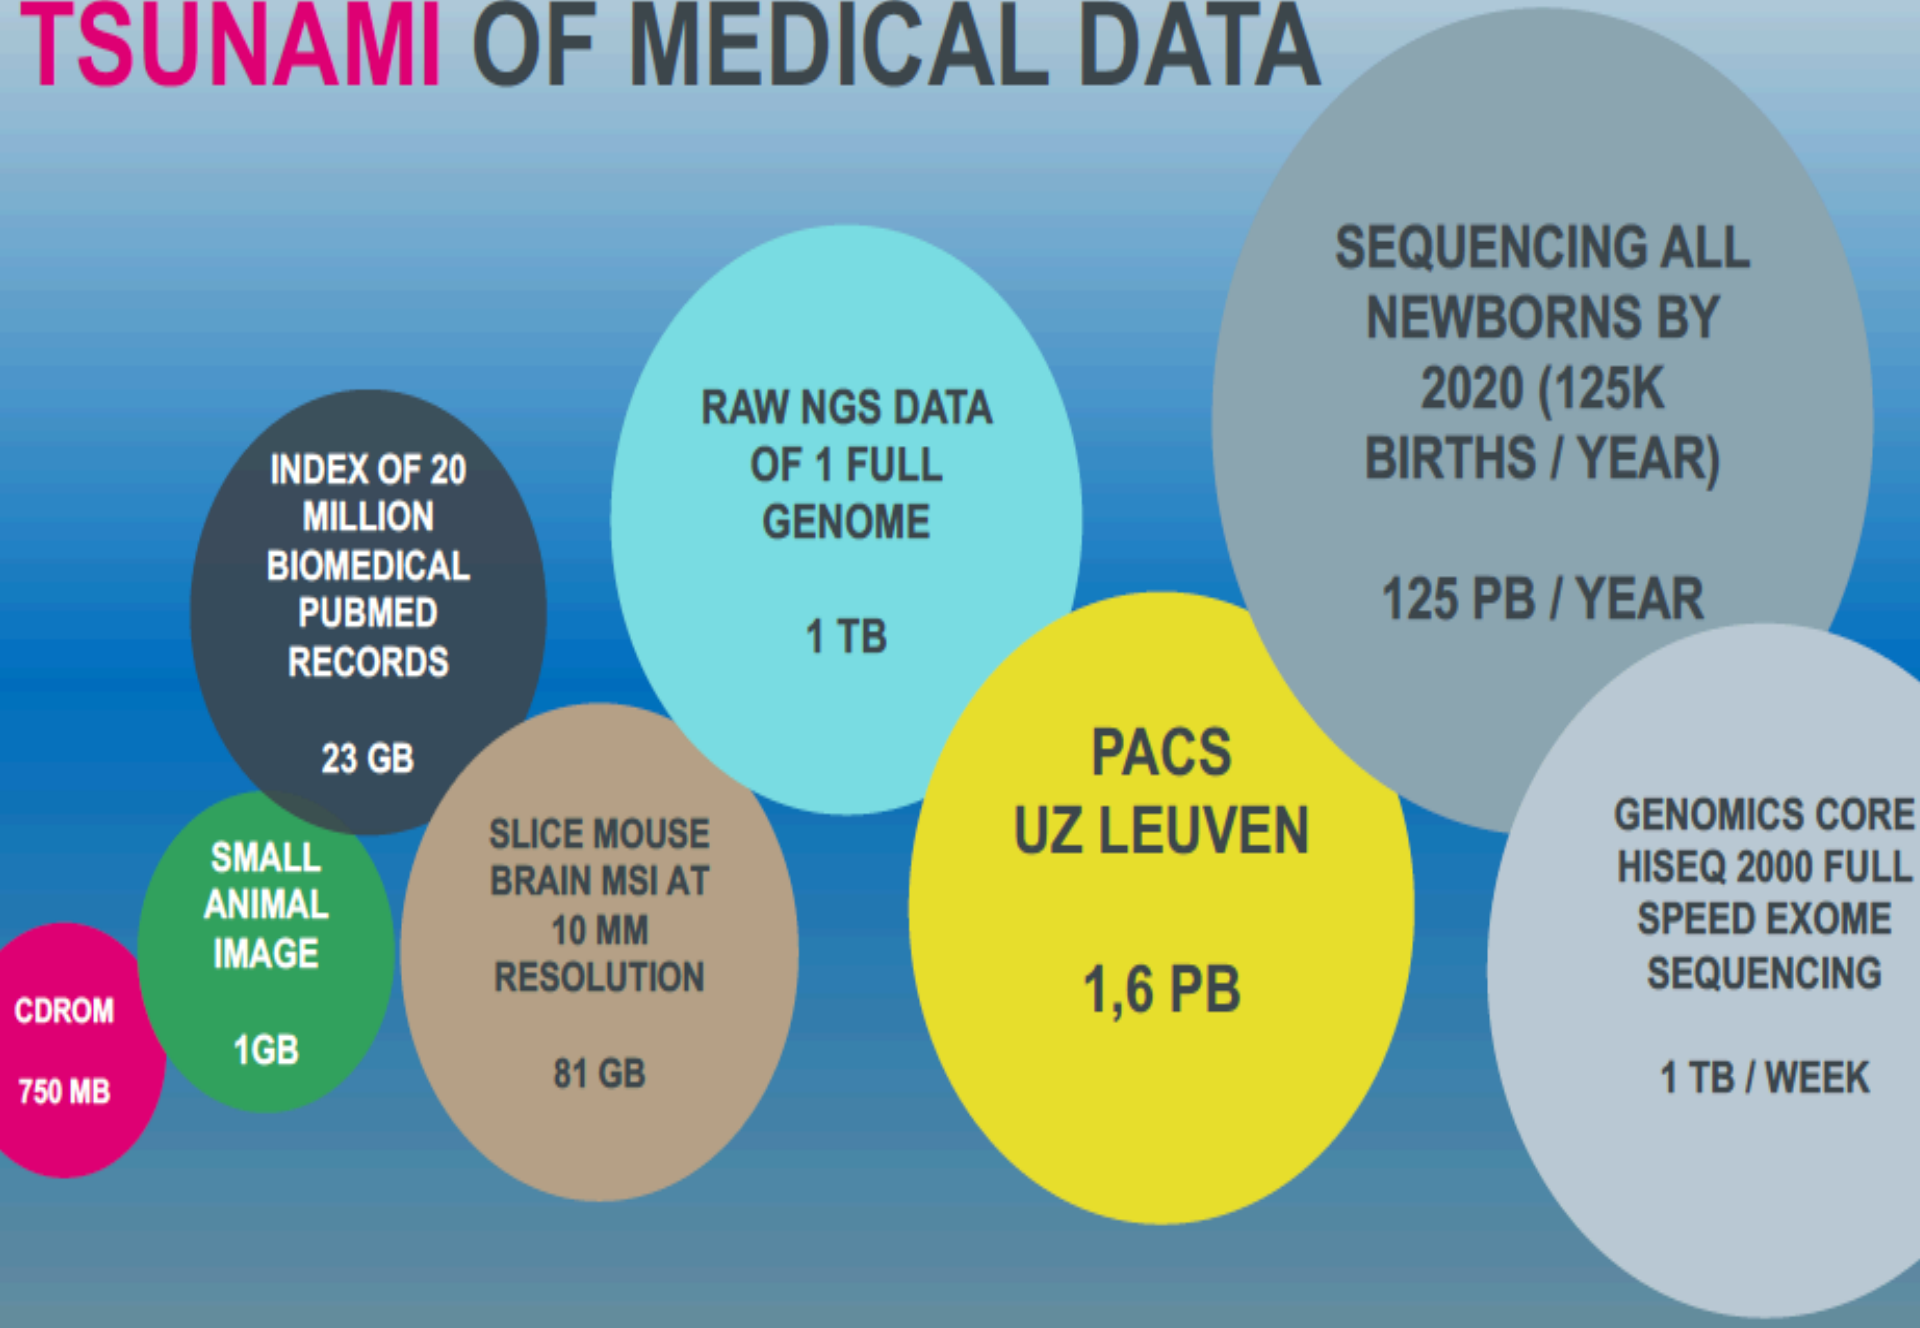
TSUNAMI OF MEDICAL DATA



ARTHUR M. LESK

The Unreasonable Effectiveness of Mathematics in Molecular Biology*

My title is an emulation of that of the well-known paper by E.P. Wigner, "The unreasonable effectiveness of mathematics in the natural sciences [1]." Of course the irony cuts in opposite ways in physics and molecular biology. In physics, mathematics is obviously effective—

many of the giants on whose shoulders physicists stand are mathematicians—and the surprise is Wigner's suggestion that this is unreasonable. In molecular biology, the proper role of mathematics is not obvious, and there is fear, far more credible than for physics, that it may be unreasonable to expect mathematics to be effective. Of course, many common *tools* of computational molecular biology—for instance, searching in databases for sequences similar to a probe sequence—are certainly based on mathematics and computer science. But whether our ultimate understanding of living processes will be expressed in the language of mathematics—in the way, for example, that concepts of symmetry underlie the statement of laws of physics—or in the traditional descriptive "anecdotal" language of biology, is still moot.

Why might it be reasonable to doubt the effectiveness of mathematics in biology? Observed properties of living systems are determined by a combination of

- The laws of physics and chemistry
- The mechanism of evolution
- Historical accident

It is difficult to sort out their effects, and a creative tension among them pervades our investigations. Many of the laws of physics describe the natural world—including living systems—by specifying relations between initial and fi-

*Based on a talk delivered at the final symposium of the program, "Biomolecular Function and Evolution in the Context of the Genome Project," at The Isaac Newton Institute for the Mathematical Sciences, Cambridge, U.K., 20 Dec. 1998.

Biology = information processing = mathematics

Dr. Algorithm is coming

"In the next 10 years, data science and software will do more for medicine than all the biological sciences together."
