

Digital Signal Processing
for Communication and Information Systems

DSP-CIS

Chapter-1 : Introduction

Marc Moonen

Dept. E.E./ESAT-STADIUS, KU Leuven
marc.moonen@kuleuven.be
www.esat.kuleuven.be/stadius/

Chapter-1 : Introduction

- **Aims/Scope**

Why study DSP ?

DSP in applications : Mobile communications example

DSP in applications : Hearing aids example

- **Overview**

Filter design & implementation

Optimal and adaptive filters

Filter banks and time-frequency transforms

- Lectures/course material/literature
- Exercise sessions/project
- Exam

Why study DSP ?

- **Analog Systems**

vs. **Digital Systems**

- Can translate (any) analog (e.g. filter) design into digital
- Going `digital` allows to expand functionality/flexibility/... (e.g. speech recognition, audio compression...)

Why study DSP ?

- Start with two `DSP in applications` examples:

- DSP in mobile communications
- DSP in hearing aids

- Main message:

Consumer electronics products (and many other systems) have become (embedded) `supercomputers` (Mops...Gops/sec), packed with mathematics & DSP functionalities...

DSP in applications: Mobile Communications 1/10

Cellular Mobile Communications (e.g. GSM/3G/4G/...)

- **Basic network architecture :**
 - Area covered by a grid of cells
 - Each cell has a base station
 - Base station connected to land telephone network and communicates with mobiles via a radio interface
 - Digital communication format

DSP in applications: Mobile Communications 2/10

- **DSP for Digital Communications (‘physical layer’) :**
 - A common misunderstanding is that digital communications is ‘simple’ ...

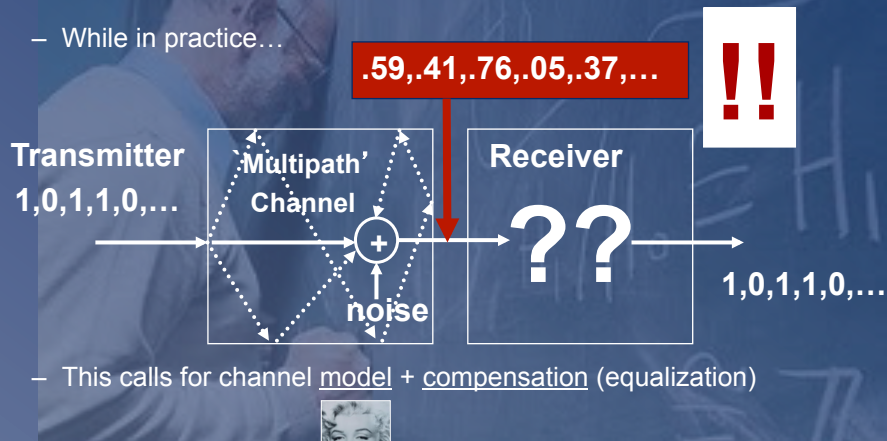

- While in practice...

PS: This is a discrete-time system representation, see Chapter-2 for review on signals&systems

DSP in applications: Mobile Communications 3/10

- **DSP for Digital Communications (‘physical layer’):**

- While in practice...

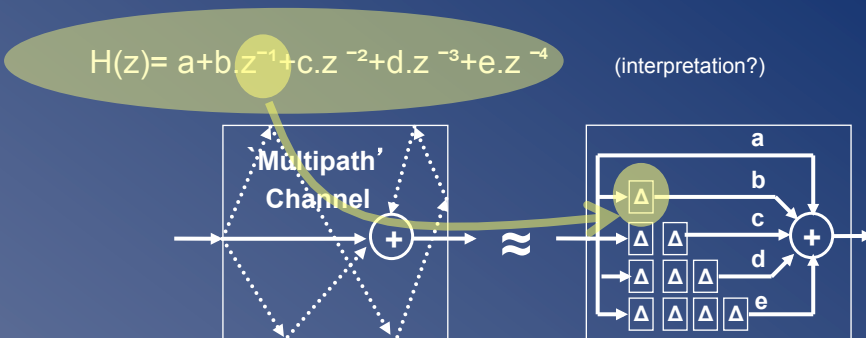

- This calls for channel model + compensation (equalization)

DSP in applications: Mobile Communications 4/10

- **DSP Challenges: Channel Estimation/Compensation**

- Multi-path channel can (e.g.) be modeled with short (3...5 taps) FIR filter

PS: z^{-1} or Δ represents a sampling period delay, see Chapter-2 for review on z-transforms

DSP in applications: Mobile Communications 5/10

- **DSP Challenges: Channel Estimation/Compensation**
 - Multi-path channel can (e.g.) be modeled with short (3...5 taps) FIR filter

$$H(z) = a + b.z^{-1} + c.z^{-2} + d.z^{-3} + e.z^{-4}$$

$$\begin{bmatrix} OUT[1] \\ OUT[2] \\ OUT[3] \\ OUT[4] \\ OUT[5] \\ \vdots \\ OUT[K] \end{bmatrix} = \begin{bmatrix} IN[1] & 0 & 0 & 0 & 0 \\ IN[2] & IN[1] & 0 & 0 & 0 \\ IN[3] & IN[2] & IN[1] & 0 & 0 \\ IN[4] & IN[3] & IN[2] & IN[1] & 0 \\ IN[5] & IN[4] & IN[3] & IN[2] & IN[1] \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & IN[K-4] \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \\ e \end{bmatrix}$$

=convolution

DSP in applications: Mobile Communications 6/10

- **DSP Challenges: Channel Estimation/Compensation**

Channel coefficients (a,b,c,d,e) are identified in receiver based on transmission of pre-defined training sequences (TS)

Problem to be solved at receiver is: 'Given channel input (=TS) and channel output (=observed), compute channel coefficients'

This leads to a least-squares parameter estimation

$$\min_{a,b,c,d,e} \left\| \begin{bmatrix} OUT[1] \\ OUT[2] \\ OUT[3] \\ OUT[4] \\ OUT[5] \\ \vdots \\ OUT[K] \end{bmatrix} - \begin{bmatrix} IN[1] & 0 & 0 & 0 & 0 \\ IN[2] & IN[1] & 0 & 0 & 0 \\ IN[3] & IN[2] & IN[1] & 0 & 0 \\ IN[4] & IN[3] & IN[2] & IN[1] & 0 \\ IN[5] & IN[4] & IN[3] & IN[2] & IN[1] \\ \vdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & IN[K-4] \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \\ e \end{bmatrix} \right\|_2^2$$

See PART-III on 'Optimal & Adaptive Filtering'

*C. F. Gauss
Then nature set my gifts, to the laws
My services are bound.*

DSP in applications: Mobile Communications 7/10

- **DSP Challenges: Channel Estimation/Compensation**
 - Channel coefficients (cfr. a,b,c,d,e) are identified in receiver based on transmission of pre-defined training sequences (TS)
 - Channel model is then used to design suitable equalizer ('channel inversion'), or (better) to reconstruct transmitted data bits based on maximum-likelihood sequence estimation (e.g. 'Viterbi decoding') (details omitted)
 - Channel is highly time-varying (e.g. terminal speed 120 km/hr !)
=> All this is done at 'burst-rate' (e.g. 100's times per sec)

= SPECTACULAR !!

DSP in applications: Mobile Communications 8/10

- **DSP Challenges: Speech Coding**
 - Original PCM-signal has 64kbits/sec = 8 ksamples/sec * 8bits/sample
 - Aim is to reduce this to <<64kbits/sec, while preserving quality
 - Coding based on speech generation model (vocal tract,...), where model coefficients are identified for each new speech segment (e.g. 20 msec)

DSP in applications: Mobile Communications 9/10

- **DSP Challenges: Speech Coding**

- Original PCM-signal has 64kbits/sec = 8 ksamples/sec*8bits/sample
- Aim is to reduce this to <<64kbits/sec, while preserving quality
- Coding based on speech generation model (vocal tract,...), where model coefficients are identified for each new speech segment (e.g. 20 msec)
- This leads to a least-squares parameter estimation (again), executed +/- 50 times per second.
Fast algorithm is used, e.g. 'Levinson-Durbin' algorithm
See PART-III on 'Optimal & Adaptive Filtering'
- Then transmit model coefficients instead of signal samples (!!!)
- Synthesize speech segment at receiver (should 'sound like' original speech segment)

= SPECTACULAR !!

DSP in applications: Mobile Communications 10/10

- **DSP Challenges: Multiple Access Schemes**

Accommodate multiple users by time & frequency 'multiplexing'

- FDMA: frequency division multiple access
- OFDMA: orthogonal frequency division multiple access
- TDMA: time division multiple access
- CDMA: code division multiple access

See PART-IV on 'Filter Banks & Time-Frequency Transforms'

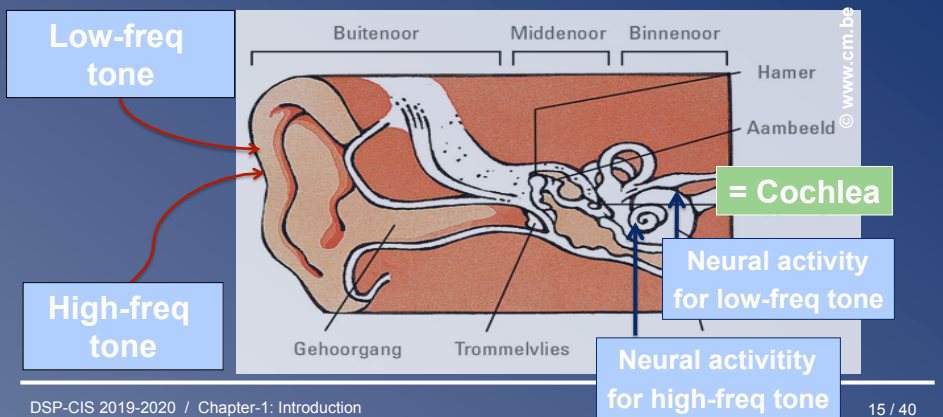

- **Etc..**

= BOX FULL OF DSP/MATHEMATICS !!
(for only €25)

DSP in applications: Hearing Aids 1/10

Hearing

- Outer ear/middle ear/inner ear
- Tonotopy of inner ear: spatial arrangement of where sounds of different frequency are processed

DSP in applications: Hearing Aids 2/10

Hearing loss types

- Conductive (~outer/middle ear)
- Sensorineural (~inner ear)
- Mixed

One in six adults (Europe) suffers from hearing loss

...and still increasing

Typical causes

- Aging
- Exposure to loud sounds
- ...

Hearing Instruments

- Hearing aids: audio output
- Bone anchored hearing aids: vibration output
- Cochlear implants: electrical stimulation output
- ...

[Source: Lapperre]

DSP in applications: Hearing Aids 3/10

→Hearing Aids (HAs)

- Audio input/audio output ('microphone-processing-loudspeaker')
- 'Amplifier', but so much more than an amplifier!
- History:
 - Horns/trumpets/...
 - 'Desktop' HAs (1900)
 - Wearable HAs (1930)
 - Digital HAs (1980)
- State-of-the-art:
 - MHz's clock speed
 - Millions of arithmetic operations/sec, ...
 - Multiple microphones

= BOX FULL OF DSP/MATHEMATICS !!

17 / 40

DSP in applications: Hearing Aids 4/10

→Cochlear Implants (CIs)

- Audio input/electrode stimulation output
- Stimulation strategy + preprocessing similar to HAs
- History:
 - Volta's experiment...
 - First implants (1960)
 - Commercial CIs (1970-1980)
 - Digital CIs (1980)
- State-of-the-art:
 - MHz's clock speed, Mops/sec, ...
 - Multiple microphones

Electrical stimulation
for low frequency

Electrical stimulation
for high frequency

= BOX FULL OF DSP/MATHEMATICS !!

18 / 40

DSP in applications: Hearing Aids 5/10

DSP Challenges: Dynamic range compression

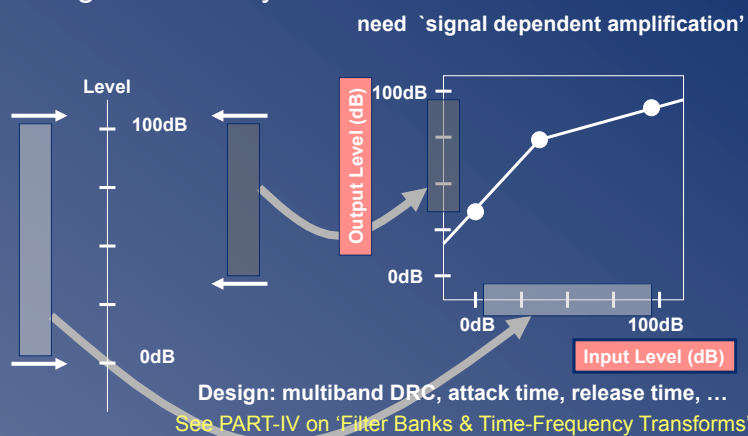

Dynamic range & audibility

DSP in applications: Hearing Aids 5/10

DSP Challenges: Dynamic range compression

Dynamic range & audibility

DSP in applications: Hearing Aids 6/10

- However: Audibility does not imply intelligibility

- Hearing impaired subjects need 5..10dB larger signal-to-noise ratio (SNR) for speech understanding in noisy environments

- Need for noise reduction (=speech enhancement) algorithms:

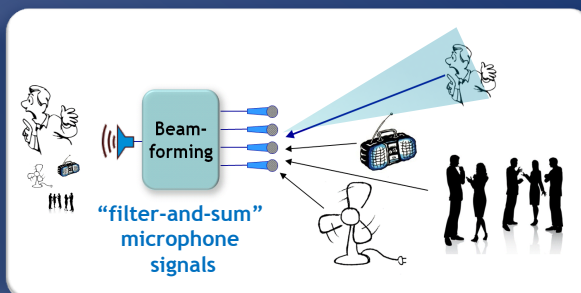

- State-of-the-art: monaural 2-microphone adaptive noise reduction
- Near future: binaural noise reduction (see below)
- Not-so-near future: cooperative HAs with multi-node noise reduction

DSP in applications: Hearing Aids 7/10

DSP Challenges: Noise reduction

Multimicrophone 'beamforming', typically with 2 microphones, e.g. 'directional' front microphone + 'omnidirectional' back microphone

See PART-II on 'Filter Design & Implementation'

DSP in applications: Hearing Aids 8/10

Binaural hearing based on binaural auditory cues

- ITD (interaural time difference)
- ILD (interaural level difference)

- Binaural cues (ITD: $f < 1500\text{Hz}$, ILD: $f > 2000\text{Hz}$) used for
 - Sound localization
 - Noise reduction
- = 'Binaural unmasking' ('cocktail party' effect) : 0-5dB

DSP in applications: Hearing Aids 9/10

DSP Challenges: Binaural hearing aids

- Two hearing aids (L&R) with wireless link & cooperation
- Opportunities:
 - More signals (e.g. 2*2 microphones)
 - Better sensor spacing (17cm i.o. 1cm)
- Constraints: power/bandwidth/delay of wireless link
- Challenges:
 - Improved localization through 'localization cue' preservation
 - Improved noise reduction + benefit from 'binaural unmasking'
 - Signal selection/filtering, audio coding, synchronisation, ...

= SPECTACULAR !!

DSP in applications: Hearing Aids 10/10

DSP Challenges: Feedback cancellation

- Problem statement: Loudspeaker signal is fed back into microphone, then amplified and played back again
- Closed loop system may become unstable (howling)
- Similar to feedback problem in public address systems (for the musicians amongst you)

Similar to echo cancellation in GSM handsets, Skype,... but more difficult due to signal correlation

See PART-III on 'Optimal & Adaptive Filtering'

= SPECTACULAR !!

DSP in applications : Other...

- **Digital Communications**

Wireline (xDSL, Powerline), Wireless (GSM, 3G, 4G, Wi-Fi, WiMax, CDMA, MIMO-transmission,...)

- **Speech**

Speech coding (GSM, DECT, ..), Speech synthesis (text-to-speech), Speech recognition

- **Audio Signal Processing**

Audio Coding (MP3, AAC, ..), Audio synthesis, Editing, Automatic transcription, Dolby/Surround, 3D-audio, ..

- **Image/Video**

- ...

Aims/Scope

- **Basic signal processing theory/principles**
Filter design, filter banks, optimal filters & adaptive filters
...as well as...
- **Recent/advanced topics**
Robust filter realization, perfect reconstruction filter banks,
fast adaptive algorithms, ...
- **Often `bird's-eye view`**
Skip many mathematical details (if possible... 😊)
Selection of topics (non-exhaustive)
- Prerequisites: Signals & Systems (sampling, transforms,..)

Overview

- **Part I : Introduction**
 - Chapter-1: Introduction
 -  Chapter-2: Signals and Systems Review
 - Chapter-3: Acoustic Modem Project
- **Part II : Filter Design & Implementation**
 - Chapter-3: Filter Design
 - Chapter-4: Filter Realization
 - Chapter-5: Filter Implementation

Overview

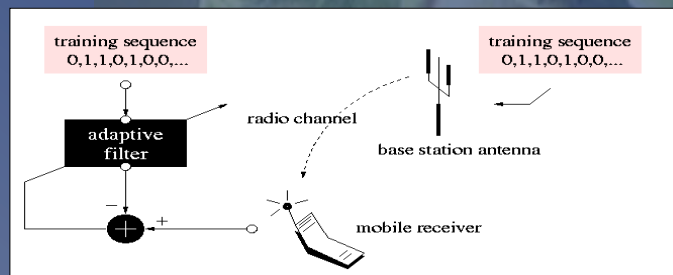

- Part III : Optimal & Adaptive Filtering

Chapter-7: Wiener Filters & the LMS Algorithm

Chapter-8: Recursive Least Squares Algorithms

Chapter-9: Fast Recursive Least Squares Algorithms

Chapter-10: Kalman Filters

Overview

- Part IV : Filter Banks & Time-Frequency Transforms

Chapter-11: Filter Bank Preliminaries/Applications

Chapter-12: Filter Bank Design

Chapter-13: Frequency Domain Filtering

Chapter-14: Time-Frequency Analysis & Scaling

- Part V : Outro

Chapter-15: DSL Technologies (Nokia Guest Lecture)

Lectures

Lectures: 15 * 2 hrs

PS: Time budget = $(15*2\text{hrs})*4 = 120 \text{ hrs}$

Course Material:

- Part I-V: Slides (use version **2019-2020 !!**)
Download from DSP-CIS webpage
Master copy available @ ESAT B00.10 (Ida Tassens)
- Part III: 'Introduction to Adaptive Signal Processing'
(Marc Moonen & Ian.K. Proudler)
= optional reading
Download from DSP-CIS webpage (if needed)

Lectures

Lectures: 15 * 2 hrs

PS: Time budget = $(15*2\text{hrs})*4 = 120 \text{ hrs}$

'Web Lectures'

- Slides with audio
- Date/Time: See schedule (!)
- Place: Your place instead of lecture room
- Support: See page 40

Literature / Campus Library Arenberg

- **A. Oppenheim & R. Schaffer (*)** Part-I
`Digital Signal Processing' (Prentice Hall 1977) Part-II
- **L. Jackson**
`Digital Filters and Signal Processing' (Kluwer 1986)
- **Simon Haykin** Part-III
`Adaptive Filter Theory' (Pearson Education 2014)
- **P.P. Vaidyanathan**
`Multirate Systems and Filter Banks' (Dorling Kindersley 1993)
- **M. Bellanger** Part-IV
`Digital Processing of Signals' (Kluwer 1986)
- **etc...**

DSP-CIS 2019-2020 / Chapter-1: Introduction

34 / 40

Exercise Sessions: Acoustic Modem Project

- Digital communication over an acoustic channel (from loudspeaker to microphone)
- FFT/IFFT-based modulation format : OFDM (as in ADSL/VDSL, WiFi, DAB, DVB,...)
- Channel estimation, equalization, etc...

Exercise Sessions: Acoustic Modem Project

- Runs over 8 weeks PS: groups of 2
- Each week
 - 1 PC/Matlab session (supervised, 2.5hrs)
 - 2 'Homework' sessions (unsupervised, 2*2.5hrs)

PS: Time budget = $8 \cdot (2.5\text{hrs} + 5\text{hrs}) = 60 \text{ hrs}$
- 'Deliverables' after week 2, 4, 6, 8
- Grading: based on deliverables, evaluated during sessions
main part=80%, optional part=20%
- **TAs:**
 - amin.hassani@kuleuven.be (English+Persian)
 - mohit.sharma@kuleuven.be (English+Hindi)
 - robbe.vanrompaey@kuleuven.be (Dutch+English+French)
 - jeroen.verdyck@kuleuven.be (Dutch+English+French)

Exam

- Oral exam, with preparation time
 - Open book
 - Grading :
 - 5 pts for question-1
 - 5 pts for question-2
 - 5 pts for question-3
 - +5 pts for Acoustic Modem Project evaluation (p.36)
-
- = 20 pts

September Retake Exam

- Oral exam, with preparation time
 - Open book
 - Grading :
 - 5 pts for question-1
 - 5 pts for question-2
 - 5 pts for question-3
 - +5 pts for question-4 on Acoustic Modem Project
-
- = 20 pts
